Subject: [TS-850_450_690] really dumb question on ts-450

Hello to all,

After all the years I have owned my TS-450S, I just noticed something I have to ask about that I don't see in the manual. I use a paddle and MFJ keyer for CW and have for a long time. Works fine.
OK, with the Keyer plugged into the back of the rig, and mode in CW and carrier up, I cannot key the rig and check output using the Send-Receive button on the left side of the rig. I have to use the key to do this. If I unplug the keyer from the 450, then the Send-Receive button works to check power out.

Is this correct??

Thanks for any input,

Don
wd0bwm

Thanks for confirming I haven't gone nuts. Guess that is the design
I never noticed.

Take care

I just switch it to FSK, then the send button works. 73

Hi All,

I am about to acquire an Amp Supply LK-500ZC which I intend to run with my TS-850. My question to the group is as follows. Does the linear amp relay in the 850 have enough muscle to switch the amp or am I best to run the Burghardt relay box I have available here? I would like to switch directly if possible but don't want to hurt the 850. Also, does anyone know if the ALC voltages are compatible?

thanks much all and very 73.

Kevin :)

I ran an LK-500ZC with my TS-850S and it worked fine. I didn't see the power out of it that I did with my TS-830S but that is to be expected. The LK-500ZC is a great amp. I wish I still had mine. UPS destroyed it unfortunately. Now using Drake L-7 which works equally well.

Yes, straight from the rig to the amp. Nothing in between that I recall.

using the external worked for me. The idea I was told, that if the relay quits, which would you rather do, find a replacement relay from Kenwood, and then resolder it in, or replace an external box

either method does work, as replies have shown you, so i guess its more your option..

check to verify

#1 that the swr/watt meter is accurate, before altering the radio
#2 are you checking this into a dummy load
#3 are you checking with cw mode, tune mode, or AM mode.... AM... I beleive will be lower, as per manual

using the external worked for me. The idea I was told, that if the relay quits, which would you rather do, find a replacement relay from Kenwood, and then resolder it in, or replace an external box

either method does work, as replies have shown you, so i guess its more your option..

Yes, straight from the rig to the amp. Nothing in between that I recall.

Topic: 7532 Message: 7537

Mack,

I will make a stab at things to check as I own a TS-450S/AT also.

1. Is the wattmeter accurate and working?
2. Is the low power on one band or all bands?? What antenna??
3. What is SWR when checking power?? Be sure to check it in CW mode, carrier up at least half way, and use "Send" button on left side. When you do this, what is power reading??

On my vertical, if SWR goes up, power will read low using settings above...this is to protect finals in radio.

Check this stuff and let us know. If you want to use email, my email is wd0bwm1@....

Hope this gives you some things to look at.

Don, wd0bwm

hi dave thanks for the reply i have ran the rig into a dummy load the
meter is accurate i have used several radios on the meter i have an
yeasu ft857 the rig with a constant tone on ssb will show around 100
watt when i use the 450 on ssb with the same tone max output is 45
watt the radio has full output on cw am and fm ssb seems to be the
problem i adjusted powe control on the rig seems like the past owner
might have turned down ssb power not sure would like to see if the
power could be increased a slight bit many thanks

Tom
I lost your original post but I THINK you said that you were getting
40 watts output
on SSB voice peaks, that would indicate to me that you are already
overdriving the rig
UNLESS you are using a peak reading watt meter.

sounds like the car knob or pwr dial are turned down too low....., or mike gain or mike itself are low...

you said cw creates 100w, what about fsk, then press the send.. you should also get full output on the meter.....

sounds like your vox may be hearing more than your voice, and causing it to stay tx... try lowering your vox gain control..... or shut off background noises........

Hi All,

The other day I said I might be buying an Amp Supply amp to go with my 850. Well, that didn't work out and it looks as if I might be buying a TL-922. I am blind and would like to get the manual for it in a form I can read. does anyone on the list have the manual for the TL-922 in an electronic format? Would you mind sending me a copy if you do?

Thanks much and very 73.

Kevin :)

What type of headset? And did you try to lower the MIC gain? Try turning the MIC Gain all the way counter clockwise then up just enough to get some power out and see if that will still do the same thing. If it does then check the wiring on the headset as in might have a slight short between the Audio+ and Audio- or pins 1 Audio+ and pin 7 Audio- or even pin 8 PTT Ground or Pin 2 PTT+.
From what you are saying I would tend to belive the MIC Gain is too high for the Headset but OK for the Hand Mic. If you have a desk MIC or can borrow one try it with that and see if the problem is still there. My money is on the MIC Gain being too high for the Headset.

What type of headset? And did you try to lower the MIC gain? Try turning the MIC Gain all the way counter clockwise then up just enough to get some power out and see if that will still do the same thing. If it does then check the wiring on the headset as in might have a slight short between the Audio+ and Audio- or pins 1 Audio+ and pin 7 Audio- or even pin 8 PTT Ground or Pin 2 PTT+.From what you are saying I would tend to belive the MIC Gain is too high for the Headset but OK for the Hand Mic. If you have a desk MIC or can borrow one try it with that and see if the problem is still there. My money is on the MIC Gain being too high for the Headset.73Roland AH6RR--- In TS-850_450_690@yahoogroups.com, Mario G <t95lwg@...> wrote:>> > Hi LA6FJA, i trayed that but nothing,as soon i activate transiever with voice he stay stuck in TX and depend where is vox delay knob i hear clicking out of radio fast or slow depend of that knob position...i tryed hand mic and works ok but with headset is not ok...> > Mario Gubo> 2310 Finch Ct.> Charlottesville,VA,22911> phone: (434) 981-2292> > To: TS-850_450_690@...: s-roabr@...: Sun, 18 Jan 2009 06:06:55 +0100Subject: RE: [TS-850_450_690] ts-450 VOX problem> > > > HiIt sounds like the VOX delay and anti vox is to highTry adjust this and it will work !73s LA6FJAFra: TS-850_450_690@yahoogroups.com [mailto:TS-850_450_690@yahoogroups.com]P? vegne av gubo99Sendt: 18. januar 2009 01:37Til: TS-850_450_690@...: [TS-850_450_690] ts-450 VOX problemvox is playing weird...i push vox buton and speak and tx stay on and i hear click click click out of radio and radio dont go in RX no more before i switch vox buton off...HELP !!!! with hand mic everything working fine if in vox mode...any idea..tnx in advance ![Non-text portions of this message have been removed] > > > > > > _____> Windows Live?: Keep your life in sync. > http://windowslive.com/howitworks?ocid=TXT_TAGLM_WL_t1_allup_howitworks_012009> > [Non-text portions of this message have been removed]>

Mario,

I had the same problem with my 850 and a Heil headset on twenty meters, but only one twenty. Turns out the length of the cord was a perfect length to couple the RF. Try making a few small loops in the cord just before your rig and see if that helps. I just wrapped the cord around my hand four or five times and ty-wrapped the loop.

Worked for me.

Good luck.

I, too, had RF mix the 850S microphone (or surrounding) circuitry in years gone by. I solved this by inserting a mix 43 ferrite rod within the "coil cord" of the mic I was using at the time. Ferrite cylinders could be used with similar effectiveness -- sliding the cable through them, I believe. Anyway, here's an excerpt from an awesome tutorial relating to interfering "common mode" and "differential mode" currents.

"A differential mode signal is one that exists between the conductors of a cable. At any given point along the cable, current flowing on one conductor is precisely balanced by current lowing in the other direction on the other conductor. The intentional signals carried by cables are differential mode signals ? the audio or video signal in a home audio system, Ethernet signals on CAT5/6 cable, and the RF signal carried by the feedline connecting our antennas to our transceivers.

A common mode signal is one that places equal voltage on all conductors ? that is, the voltage between the two ends of the cable are different, but there is no voltage between the conductors. Antenna action produces a common mode voltage and current along a cable. The antenna current induced on audio and video wiring is a common mode signal. That is, with "ideal" cable, there is no differential voltage between the signal conductors as a result of this antenna action. If the cable is shielded, nearly all of this current flows on the shield (and skin effect causes it to flow on the outside of the shield)."

For a great, yet understandable, technical paper on Ham RFI and its reduction, reference K9RC's paper:
http://www.audiosystemsgroup.com/RFI-Ham.pdf

Good Luck!

7555. rehabilitating a TS-850 including filter selection.

Yahoo group: TS-850_450_690 (2006 — 2009)

Topic: 7555 Message: 7555

Kenwood TS-850_450_690Hi all,

I just ended up with a "fair to poor" condition TS-850 that really needs some TLC. It was owned by a sometimes smoker and lived in a box for at least 2 and as many as 5 years before it came to me. It needs a good scrub on the outside and heaven's knows what on the inside (I was afraid to open it and become depressed.) I also suspect that not everything works properly (based on the owner and his efforts to get rid of the thing) and I'd rather work on repairs now, rather than get it all cleaned up and back together and then discover problems. There are also several items I need to go shopping for (microphone, filters, connectors, etc.)

Right now this is the only HF radio in the shack. I had some older gear and managed to get good prices for clearing things out as part of a plan to purchase some more modern gear. The plan for this radio is to learn a bit while getting it back into condition, and then to either keep this as a backup at home, to take it over to my parent's house where we visit often, as an enticement for my father to upgrade and get his general. Either way, I don't see this one leaving my hands. I'd like to go through it, clean it up and get it fixed up for hours and hours of enjoyment.

First, on the cleaning front, any words of advice on cleaning? Not being sure about the plastics, I was thinking dry stiff brush for dirt, toothbrush for the small, close areas and then water on a rag to wipe it down on the outside. I suspect there will be a nice coating on the inside from years in front of a smoker. I have electro-wash from chemtronics and was going to look at Frys to see what they had that was similar. Is there a better process? I'm also looking for any ideas, comments, experiences that others have had with this sort of thing. Any sorts of issues like the TS-440 and the potting compound mess?

Second, testing and any necessary repair. The thing does power up and switches through the bands. I put it on a dummy load and keyed it and the red light went on. I haven't hooked up a watt meter yet (mostly due to time - but I'll get to that soon.) I'd like to find the problems now, rather than get it all cleaned up and then have to take it back apart for repairs. I'm going to look for the service manual, but I'm also looking for practical experience out there in triaging this thing first.

Also, I've been looking over a few TS-850 sites and see that there are a wide variety of mods and "improvements" that can be done. Anyone have "must do" things that they would recommend?

Lastly, this thing has nothing inside, that is, no filters, etc. and is missing the microphone. I've got a MC-60A borrowed from another radio for the time being, but I think I'd like a hand mic as well as a desk mic

(possibly one of the Heil ones.) I also need to locate a source for connectors. This thing is getting connected to at least a computer and maybe other fun stuff, but to do that I need to find connectors to build the cables. I'm planning on reviewing the messages in this group for information about filters, but I'm also glad for any direct advice. If you have advice (filter and microphone choices, connector sources) or have filters or mics for sale, please let me know. If you do, keep in mind that this is a tight budget project for me so I'm looking for rock bottom prices (aren't we all?)

Thanks in advance and you can either respond to the list, or contact me directly (kb7wsd@...)

73,
Grant

Hi,

Last year I went through the same situation that you are currently faced with. I used Greased Lightning to clean the outside of the case. I didn't spray it on the radio but I used it on a cloth for big areas and on a cotton swab for the front panel. It worked very well and the swabs and cloth looked disgusting when finished.

As far as inside the radio... I decided to send the radio to B&B Technical Services in Colorado (http://www.amateur-repairs.com/) for their "Full Monte" treatment. The results were spectacular! My TS-850 has to be the finest radio I ever owned.

Good Luck!

Gary, N2UM

7558. TS-850S Display Inverter

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-01-26 08:35:40 UTC
From: Ashley
Topic: 7558 Message: 7558

Hello list,
We have a TS850SAT with a slight display problem; when the radio is powered up after a day or so unpowered, the display takes about 15-25 seconds to "come on"
Some reading in various forums has led us to the conclusion that perhaps the electrolytic cap on the input to the inverter may be leaky, and one cause of this 'delay"
We are going to replace the capacitor with a higher voltage (25V VS 16V) but we are wondering if anyone has any experience fixing a problem like a "slow to appear" display ?
Second, does anyone have any idea what is inside the inverter metal box ? Is this gizmo repairable ? Does it have a history of failure ?

Thank you very much
Kiss-Electronics
Ms Ashley Hall

Replace the cap but make sure you check the all the traces around the cap they can be damaged from the old cap leaking. I replaced one on a friends radio that was doing the same thing and had to repair some of the traces. it works like a charm now. I have been lucky with mine it has been like the old Timex watch's takes a licking and keeps on ticking. I did have a problem last night but it was with a bad/old fuse in the negitive side of the power cord.
Good Luck

I saw sometime back that someone was replaceing the DSS chips if you sent them the the board but I lost the information.I have one that has the old ones on it and am starting to have problems. I used a known good carrier board [with the newer #'s on the chips] and everything works as it should.I need someone to do the work.
Tnx's Mike [k5box]

Aloha Mike,
I sent my CAR board to Cliff at AVVID and he did the repair and it
was perfect after that.
http://www.avvid.com/ should get you the contact info

Good Luck & 73

7562. Has there been a firm decision regarding a INRAD roofing filter for the TS-850S?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-01-29 03:49:19 UTC
From: Steve Gehring
Topic: 7562 Message: 7562

All,

Has INRAD ever issued a firm ruling for or against a TS-850S roofing filter? I believe the 450/690 was diss'ed, but the 950 got one. There are many 850's out there...

Any thoughts?

I've emailed them just recently, with no response as of yet.

7563. Hi and I have a question

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-01-29 14:23:00 UTC
From: Wayne Irwin
Topic: 7563 Message: 7563

Hi Folks,

At one time I had a TS-850SAT and I can honestly say it was the best HF rig I ever owned. I am sorry I sold it but as you know, such things are sometimes necessary. I am interested in finding another one of these days, but since the early ones did have some problems, I am wondering if anyone could give me an idea of where the "bad serial numbers" leave off and where the "good serial numbers" begin? My rig was a 20 million S/N and I know that was an old one, though I never had a problem. I have been told that above 60 million is good with the newer IC chips in it, but have not been able to confirm that. Any comments would be appreciated.

Hi all,

a Roofing Filter onTS-850, it's possible, you can use the roofing filter
for the FT 1000 D.

read how, page is now in english, here :

<http://pagesperso-orange.fr/F6AOJ/cariboost1/crbst_178.html>

Til: TS-850_450_690@yahoogroups.com
Emne: [TS-850_450_690] Has there been a firm decision regarding a INRAD
roofing filter for the TS-850S?

All,

Has INRAD ever issued a firm ruling for or against a TS-850S roofing
filter? I believe the 450/690 was diss'ed, but the 950 got one. There
are many 850's out there...

Any thoughts?

I've emailed them just recently, with no response as of yet.

Thanks and 73!

7566. TS-850SAT Display "Slow to come on" Notes

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-01-29 21:37:37 UTC
From: Ashley
Topic: 7566 Message: 7566

Hello All,
We posted a "display slow to come on" question here a while ago and received some terrific suggestions, almost all of which involved the three bypass capacitors on the display board, particularly C18. (C18 is not shown on the schematic, but does appear on the PC board layout).
Anyhow, we replaced C18 with a good quality 470uf/25V capacitor (and while we were in there we replaced the other two bypass electrolytics with 100uf/25V units) as well.
The good news to all of this is the display comes on within 3-4 seconds of power on, so I'm guessing the problem is fixed.
Thank you to everyone who responded.

Thank You
Kiss-Electronics

7567. TS-850 IF Board Schematic Query

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-01-30 21:15:03 UTC
From: kremper4-850@yahoo.com
Topic: 7567 Message: 7567

While performing the CW sidetone modification, I noticed what appears to me to be a difference between the IF-board component placement and the schematic in the area of IC7. I can't be certain of the component IDs because my copy of the Service Manual parts-placement diagram isn't clear.

The schematic shows IC7 pin 2 as being connected to R227 (100 k) and C172 (0.1 uF). The other end of R227 connects to IC7 pin 1. The other end of C172 is shown connected to R229, R230 and R231. However, on the PC board in my '850, it looks as though a trace connects C172 to IC7 pin 1. I verified the connection with an ohmmeter.

Can anyone identify what I'm seeing -- or what I think I'm seeing?

73,

Paul / N1FB

Have a look at the Softrock40 yahoo group. There have been several guys there that have done something like you mention. I connected into the 455 KHz IF because I didn't want to give up my 455 KHz filters. I like it that way better. You can have a look at my web page at:

http://people.wallawalla.edu/~Rob.Frohne/SDR/SDR-Shell/

And the latest SDR-Shell code for IF applications is available from the svn at:

http://code.google.com/p/sdr-shell/

It probably has 1 bad relay which will hose everything EXCEPT the band
it's on. Make sure the band select IC is working correctly.

On a related topic, I am working on a TS-430S for a friend. The finals (2SC2290) and drivers (2SC2509) are all blown.

The TS-850S uses different finals but the same drivers. They seem to be hard to come by. The 2SC2509's are not made anymore, at least with the pin configuration BEC as seen from the front with the leads facing down.

There is a Kenwood note recommending 2SC3133, which also seem hard to come by. Other possible replacements are the MRF479 and 2SC1945 (which have the correct pinout).

The best bet looks like the 2SC1945. Has anyone tried this?

Any other recommendations?

I have the exactly same problem, 160, 80,40, 30 all ok (110 watts)
rest f the band lower power (10 meters almost nothing)

i check all the diodes (out of the board) and all looks ok, i check
the voltage in the ic1 and all ok except the band selected and the
pin 2 always low voltage.

its posible this ic1 its faulty?

can anybody apoint me to any direction?

thanks

It could be R39 which is the pullup resistor or the IC is bad. Try cutting the leg on the IC and if it goes to 14v try the radio. That is the .5-1.6 BPF and if it's on will kill the higher bands on TX and affect RX.

Thanks for the information.

i remove R39 out the board and its ok, 10k (in the board was 6k2 ohms... its curius cause the rest of the resistors R34 till R40 read 10K exactly in the board)

i insolated leg 2 (ic1) and i have 0 volts in this leg. The rest ok except the band what i select.

the radio is working now in all the bands 100 watts.

Do i must to remplace this ic? or do i must to look for any other component faulty?

thanks one more time.

Yep, the IC is bad. Not uncommon but luckily it's a common IC and not expensive. Since that only affects the broadcast band (US broadcast band) from .5-1.6 mHz you could just leave it alone until time to sell it.

7583. Best Mic for the 850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-02-07 05:11:11 UTC
From: Kevin Nathan
Topic: 7583 Message: 7583

Hi All,

I am driving my TS-850 with a Heil Goldline which also has the HC5 element. I typically use it on the wide range element though with the high boost in on the 850. The trouble is that even with the mic gain wide open, something I am reluctant to do, it doesn't push the needle very high at all into the ALC zone on the radio. Other than the MC-60A or similar Kenwood mics, does anyone on the list have a suggestion as to the best desk or boom mic, preferably a boom mic, which might drive the socks off of the 850? Low cost would be good as well. I would appreciate any thoughts on the matter.

thanks much and very 73.

Kevin :)

Kevin,

Find a Shure 522 desk mic on eBay. I found a like-new one for $5
there. The 522 has the same response curve as a gold-line, yet drives
the 850 very well. The 522 is also quite unidirectional.

It's awesome. My mic gain varies between 9 and 10 o'clock -- the latter
on 160M only. I also use the mic with the high-boost "on" all the
time. Moreover, the 522 also looks good, and is extremely rugged.

See the 522 reviews on eHam.

The best Mic I found with my TS-850, and other Kenwood radio's - TS-940, TS-2000, TS-50, TS-440 is, in fact, an Icom SM-8 desk mic.
I cannot begin to explain what a wonderful mic it is. You have tone adjustment under the mic - while speaking adjust the tone till it sounds best...or turn it more bassy when speaking with strong locals, and then make it more treble when working weak dx. Also under the mic, are two very powerful mic gain adjustment pots - one for each radio. You can connect two radio's to this mic, and switch between the two with the switch on top of the mic. And the audio ? just fantastic !!!! I also have
heil goldline mic's, with the broadcast and regular element, and the SM-8
sounds far superior.

Hi John,

I will add this one to the idea mix and see what I can find.

Thanks much and very 73.

Kevin :)

The best Mic I found with my TS-850, and other Kenwood radio's - TS-940,
TS-2000, TS-50, TS-440 is, in fact, an Icom SM-8 desk mic.
I cannot begin to explain what a wonderful mic it is. You have tone
adjustment under the mic - while speaking adjust the tone till it sounds
best...or turn it more bassy when speaking with strong locals, and then
make it more treble when working weak dx. Also under the mic, are two
very powerful mic gain adjustment pots - one for each radio. You can
connect two radio's to this mic, and switch between the two with the
switch on top of the mic. And the audio ? just fantastic !!!! I also
have
heil goldline mic's, with the broadcast and regular element, and the
SM-8
sounds far superior.

Kevin,

Find a Shure 522 desk mic on eBay. I found a like-new one for $5
there. The 522 has the same response curve as a gold-line, yet drives
the 850 very well. The 522 is also quite unidirectional.

It's awesome. My mic gain varies between 9 and 10 o'clock -- the latter
on 160M only. I also use the mic with the high-boost "on" all the
time. Moreover, the 522 also looks good, and is extremely rugged.

See the 522 reviews on eHam.

Thanks Clif

I just replace the ic and make all the adjustment and the TX is fine. (using the service manual)

I just connect the antenna and the speakers and i almost do not have reception (no signal on s-meter). i check and re-check all the board ans i think all is perfect.

if i connect the antenna in the anode of D3 i have reception (not 100%)

if i connect the signal before the C8 (before D3) i have just a Little reception (i re-check all the attenuators and are off)

R1 and R3 are OK.

Any body have any idea where do i must to look?

thanks in advanced.

I am using the Heil Goldline (HC5 element) with my TS-850, and the TS-2000. It works great for me, good audio reports also has the HC5 element. You must have some other problem with the mic. I'm sure you have tried it with other microphones, if so the radio is not the problem.

Check Q49 for 12v on the collector, if not then replace it.

Kevin,
I used a Heil BM-10 with an HC4 element, and had adequate mic gain, so there may be another problem here.The problem I had was repeated failures of the HC4 element, three, in total.Looking for a more economical replacement for the Heil elements, I built the project mic that is on the ARRL web site.In TIS, under "Projects for the Ham Shack", "An Inexpensive Amplified Boom/Headset Mic".This project was also published in the 1999 Handbook.I built the unamplifed headset version.This project uses a Radio Shack 270-090 electret cartridge, a .01 microfarad DC blocking/coupling capacitor in the mic input line, and a 10 K ohm biasing resistor from the 8 volt pin in the mic connector, to the mic element.I mounted the resistor and cap inside the eight pin mic connector.The results: plenty of gain, very good audio response, and very low cost.It seems to be as good, if not better, than the pricy Heil elements.

One other piece of advice.If you try this, stick to the specified component values.I tried a larger value capacitor, and did not have good results.Mic gain was very touchy, and the audio response was very basey.

The amplifed desk top version of this project includes seperate high boost, low boost, and gain controls.

Good luck,

Al
KJ5GT

Thanks Al,

I'll keep this in mind also. The reports I'm getting from people are that although the ALC isn't being kicked much, my audio sounds good and many of my friends say not to change a thing. so, right now I'm just gathering information. <GRIN>

Again, thanks much and very 73.

Kevin :)

Thanks Cliff.

Q49 ok, and i have 12 V in the colector. Transistor looks ok.

just one comment.

if i remove the antena conector in CN1, using an ohmeter between GND and the center of this CN1 i have 0 ohms, also if i check between gnd and the diferents points r1, r3, l3, l4 (before and after this components) its this normal? looks to me as short circuit? Do i must to remove all the capacitor to see if any is in short?

The attenuator works ok, and do the swich in the diferents positions ok. R1 and R3 ok. L3 and L4 0 Ohms (i dont have te tools to read the impedance)

In the katode of D3 i have 7,3 volts in Rx a little less in tx (manual say 6.7 Volts)

Thanks for all the help, i really apreciated.

tony ea8uk.

That's not good. Unless there is a change to put a choke to ground not shown in my service manuals.

Remove C3, 5, & 7 and see if the short goes away, one at a time. If C8 were shorted you would have 8v there...

Hi Again Cliff, your knightmare again.

Ok, C5 was in short, C3&7 are ok.

Now i have reception, but if i compare the reception with my ts870 there are a big diference, in AM (7125) whit the 850 i get signal 3, 4 and whit the 870 signal is 9 or 9+

in 80 meters almost the same,

Any idea whare do i must to look.......

Thanks in advanced

Tony ea8uk

I would replace L3 & L4. The s-meters are spec'ed at the same point for S-9 so should be comparable. Check the attenuators for the proper drop in each. If they are Ok try the other caps in the filter you are working on.

Topic: 6674 Message: 7600

Clif.. I need sage advice regarding the replacement of one the variable caps in one of the VCO cans for 430Mhz in my TS-790A....Is there a standard method of pulling those boards off the main board or...? 73...Jordan....

From: Clif
Topic: 6674 Message: 7601

I use a Pace Vacuum Desoldering station. The main thing is to make sure the 3 wires are free otherwise you can pull out a plated thru hole. I wouldn't try it with just solder wick. At the min a hand operated desoldering tool.

Subject: [TS-850_450_690] Best Mic for the 850

Hi All,

I am driving my TS-850 with a Heil Goldline which also has the HC5 element. I typically use it on the wide range element though with the high boost in on the 850. The trouble is that even with the mic gain wide open, something I am reluctant to do, it doesn't push the needle very high at all into the ALC zone on the radio. Other than the MC-60A or similar Kenwood mics, does anyone on the list have a suggestion as to the best desk or boom mic, preferably a boom mic, which might drive the socks off of the 850? Low cost would be good as well. I would appreciate any thoughts on the matter.

thanks much and very 73.

Kevin :)

From: Kevin Nathan
Topic: 7604 Message: 7604

Hi All,

What recommendations would any of you have for an outboard DSP unit to run with the 850? the Time Wave 599ZX looks like much more than one would need. I would appreciate any ideas of less expensive units which might give good noise reduction and not cost an arm and a leg. I have listened to sound files of the SCAF 1 from Idiom Press. Has anyone used that device?

thanks much and very 73.

Kevin :)

7605. Outboard DSP

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-02-09 11:23:48 UTC
From: Phil Hartwell
Topic: 7604 Message: 7605

Hi Kevin,

Before you shell out on external DSP units, try downloading some free DSP filter software and utilize the soundcard in your PC. Google JE3HHT, his is a very simple free program with many pre-defined DSP filters for different circumstances and modes. You can alter them to your own requirements or even design and store your own.
There are many more complex programs that incorporate waterfalls etc., but try this one first.

I use a D104 as well. But I also use the Goldline with HC-5 element as well as a Heil headset with the HC-5 element. I run them all at about 9:00 setting with good ALC deflection. I wonder if there si something worong with your mic cable on the Goldline

Thanks Clif

I just remove again C7 and also C4 and C6, this last to are ok, C7 is reading 90 p F, i think this must be 98pf (i have the service manual in pdf and its not clear the numbers can you confirm the C7 capacity?), anyway i just remplace this las two C7&5 as normal ceramic capacitor (not smd), i must to visit the shop and buy some new smd components. This weekend i will finish all the test, but i just re-check the reception on 20 meters, and now looks the oposite, 850 have more reception than 870. in 80 meters 870 have a better reception then 850, but i will check deep this weekend.

I will check deep and will back whit the final results.

I want to thank you Cliff for all the time and help, i really apreciate this help.

7612. TS850 CAT PTT AND MIC-IN ???.

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-02-11 17:20:34 UTC
From: javijust
Topic: 7612 Message: 7612

Hi everybody.

I'm using TS850 with CAT software. When I pitch TX (with CAT command), the transceiver begin to transmit, but the front MIC-IN input connector is disabled, so I think that is only posible to inject the audio signal in the rear input, when PTT via CAT command is activated.

Do you know, how activate the MIC-IN input (in the front of the transceiver) to use any microphone or audio system, and activate the PTT with a CAT command?.
With TS570 works fine.

Thanks in advance.

I was also saddened to learn of Bill's passing. He once did some work on my TS 850 (mods, changing battery, etc.) and he did an excellent job. Bill was a gentleman and wanted to do the right thing. He provided a valuable service to the ham radio community. RIP Bill and may God be with your family.

Topic: 7612 Message: 7614

I believe the mic in is muted by ptt being on pin 9 (then jumpered to pin 13. remove connection to pin 9..

7615. TS-850sat/ Cooling fan problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-02-12 17:14:41 UTC
From: n2unl
Topic: 7615 Message: 7615

I purchased a 850 with a mod to the cooling fan. They installed a external switch to direct 12v supply to the fan and i want to put the fan back where it suppose to be pluged or soldered (?)in on the board and go from there. Maybe the there is nothing wrong with the radio to control the fan but i have to start by finding where the fan plugs into to start.
Thanks to all reply's. Brian

7616. TS-690S infinite output v.s.w.r.

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-02-12 18:24:31 UTC
From: david269140
Topic: 7616 Message: 7616

My TS-690S has just developed this fault.

With the HF antenna port terminated in a dummy load all HF-bands display an infinite v.s.w.r. and the power consequently is pegged at around 10W or so.

For the 50MHz band there is a switchable option to select either an alternative antenna connector or the HF antenna connector.

With the switch set to the alternative (50MHz) connector and terminated with a dummy load I can achieve full output with 1:1 v.s.w.r.

With the switch set to the HF antenna connector and terminated with a dummy load the TS-690S displays an infinite v.s.w.r. and the output, as expected, is considerably reduced.

Clearly there is a fault associated with the HF antenna connector (switching) circuity.

Has anyone else had experience of this fault and/or can offer advice as to its cause.

```

In Kenwood Service Bulletin ASB 1046, mention is made of a 2nd mixer FET change from the 2SK520 (K44) to the 2SK520 (K43). I've been unable to locate a data sheet or source for these FETs. Does anyone know of a link for this information?

73,

Paul / N1FB

From: david269140
Topic: 7616 Message: 7618

OK - maybe I should have taken the covers off first before firing off an email to the group.

I found the fault!

I thought it might have been the switching relay but it was actually associated with the (HF) antenna connector.

There is a very small circuit board spigot 'W1' from which a 3mm long wire attaches to the centre conductor of the output socket.

Mysteriously it had disappeared. It almost looked like there was a dry joint on the centre connector, but the wire was missing anyway.

The back panel onto which the two SO-239 connectors are attached can flex a small amount.

I had been playing around with coaxial patch leads - commisioning a new amplifier - and I reckon it doesn't take much effort to significantly flex (more than a few millimetre) the back panel. This probably snapped the very small (3mm) link to the antenna connector.

Moral: Don't waggle your antenna lead when attaching it to the antenna socket especially if, like me, you use relatively inflexible 1/2" coaxial feeder.

7620. Shure 522 Mic Wiring Pinout to TS-850S

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-02-13 18:44:40 UTC
From: Steve Gehring
Topic: 7620 Message: 7620

Someone emailed me concerning this, but somehow I misplaced or deleted the email.

Here's the info for wiring a Shure 522 to a 850S:

Pin 1 = Audio (White)
Pin 2 = STBY or Key Line (Red)
Pin 7 = Audio Ground (Green) *AND* Chassis (Shield)
Pin 8 = STBY or Key Ground (Black)

That's it.

Note: The 522 has provisions for a balanced output, hence Pin 7's unbalanced "two-wire" grounding configuration for the 850's "Foster" connector input.

73.

7623. Corrected: Shure 522 Mic Wiring Pinout to TS-850S

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-02-15 02:49:55 UTC
From: Steve Gehring
Topic: 7620 Message: 7623

All,

I rechecked the wiring between the attached Shure 522 pdf file against the 850S Instruction manual, and couldn't find anything wrong... then I actually opened up my mic's foster plug to see how I did it a few years ago.

Try this... for it works on my 850S:

Correct Wiring:

Pin 1 = Audio (White)
Pin 2 = STBY or Key Line (Red)
Pin 7 = STBY or Key Ground (Black)
Pin 8 = Audio Ground (Green) *AND* Chassis Ground (Stranded Shield)

Why the wiring between pins 7 & 8 (center pin) is now reversed is intriguing! It doesn't match the instruction manual... maybe someone made a mistake on page 13 of the Instruction Manual. Anyway, this is what works (above).

Anyhow, the 850S requires a unbalanced input. You'll notice the Shure 522 pdf Table 1 indicating the green wire NOT float, but be grounded to the sleeve of a typical 3-wire phono plug of old (same as the shield) for unbalanced wiring. In a balanced configuration, both the white and the green wires would carry audio out-of-phase (tip and ring), with the tip also carrying PTT.

Hi Tom

Filters work only in receive.

Why would you want to make your transmit wider?? Best is to have it as narrow and clean as you can. Wider makes splatter. 73

I'm using the TS-450 for mobile operations. I have found that when I first turn the radio on. The audio is not there, meaning I need to either key the radio or key the ant. turner to have full audio. I have rechecked the ground, tighten down all the screws (both in side and out) on the radio.

If I'm not moving I only need to do this at the start of the operation. But going down the road the audio is in and out all the time. The radio is sitting on a board and is strapped on to the front seat of my vehicle. I'm looking for any ideas. Thanks, Jim

The S-meter is at the bottom of the scale and the squelch is set at
wide open. Its acting like some thing is not making full contact.
Because the bumps on the road or my tapping on the cast will get the
same reaction. My only guess is maybe a relay is hanging up a little.
But I wouldn't think that it would be off and on. That is why I think
something is loose and not making a solid contact.

Most common thing I have found is the contacts on the SO-239 are
spread out a bit and intermittent. Try gently bending the "fingers" in
slightly and see what happens.

Not only that, but I've been told the 2SC2509's used in the rigs have a different pin-out. For some weird reason the newer ones are EBC. The old ones were BEC. The ones used in the rigs must've been specially made for the Kenwood rigs and are no longer available. I don't know how else to explain that!

It appears you're correct about the pin arrangement, Zack.

The pin identification for the TS-850's 2SC2509 drivers (two are used) I see in the TS-850 Service Manual is different from that given in an NEC data sheet I downloaded for comparison. That difference could spell trouble.

7633. Inexpensive (about $20 shipped) USB to Kenwood Computer Interface

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-02-18 03:43:24 UTC
From: Rob Frohne
Topic: 7633 Message: 7633

Hi Everyone,

I recently wanted to update my computer control cable on my TS-850SAT to a USB one with RTS/CTS support. It took me a bit of work to get it all sorted out, but the result was worth it, especially with IF-232C units still going for more than $50 on ebay.

This interface should work with the following Kenwood radios: TS-50, TS-60, TS-140, TS-440, TS-450, TS-680, TS-690, TS-711, TS-721, TS-790, TS-811, TS-850, TS-950, R-5000.

I put up a short page on building it at:

http://people.wallawalla.edu/~Rob.Frohne/SDR/USB%20Interface/IF-232%20USB%20Replacement.html

I hope this is of use to some of you, and that it will make doing it much quicker and easier than it was for me.

73,

Rob, KL7NA

I think the PS-53 is a 22.5 amp supply vs. the 20 listed on the Universal Radio page. Didn't the TS-850S require a 20.5 amp supply which effectively directed everyone to purchase a new supply along with their radios as most of the supplies found at most operating positions at the time were 20 amps?????? I know mine was.

BTW, I like the PS-53 supply fine but it matches the 450/690 line. All of my power comes from a pair of 35 watt Astrons under the bench, out of sight. They don't look as nice but they are a lot cheaper.

Most of you probably read this but some might not have. Article in ARRL QST magazine, "The TS-850S, 13 years later." You don't have to be a member to read it.

PS-50 also works just fine. Although it was designed to match the TS-440S,
I've been using one with a TS-850 for 10 years with no problems.

Surely not! Almost all 100W HF rigs are "rated" to draw at least 20A, but I've never seen one that did.

The Kenwood 430 and 440 also supposedly took 20.5A, according to the Universal web page.

That is a worst-case current draw that will seldom, if ever, be reached in practice. My 850 generally drew about 17A at 13.8V when running full power. That's 235W input, by the way. 20.5 A at 13.8V would be 283W input!

However, except times when I've been really strapped for cash, I've always tried to use at least a 25A supply so it wouldn't have to work very hard.

I'd sure like to have my 850 back...

ts for the 850 was built kenwood ps-52 dedicated, but you can make if
you do not find the kenwood ps-53, are the power supply to 13.8 volts
16 amperes, cooling through forced ventilation automatic limit exceeded
overheating

You are very welcome. Really shows you the impact the radio had and how it has lasted. W3ZZ, in the latest issue of QST, compared transverter IFs using the new Elecraft, Flex Radio as well as a TS-850S. Not much difference in terms of performance for the application. You have to wonder what Kenwood was thinking when they quit building it. There must have been something else out there that everyone else wanted, parts were getting too expensive or hard to find, etc. It would be interesting to know. I think the 450/690 is a great radio too. Have both of them as well as an 870. I can't figure out whether I like the 870 better or the 850 so I have both of them at my operating position. :)))))

From: Kurt Cathcart
Topic: 7649 Message: 7649

Hello,

My TS-450 has developed a problem in the past few days. Occasionally when I transmit the SWR goes sky high and when I stop transmitting the receiver sounds like I don't have an antenna connected. Sometimes thumping the PTT or hitting a few dits on the key will clear this up. Sometimes engaging the auto tuner will help also. This last time it seems to be stuck in this bad condition. I'm thinking there is a problem with a relay somewhere. Where do I start looking?

Hi Curt

Check the connection going from the antenna coax connector to the board.
This has been known to come loose and flex away from the board. 73

7651. RFI When Using TNC

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-02-21 22:22:48 UTC
From: Kevin Nathan
Topic: 7651 Message: 7651

Hi All,

I am encountering a problem with my 850 when I use my Kam TNC. When I have the cable connected from the HF port on the back of the Kam to the DIN connector and RCA RTTY jack on the radio I get a ton of RFI when I try to talk on SSB. Has anyone experienced this RFI and is there a cure?

Thanks much all and very 73.

Kevin :)

Greetings,

I was curious if anyone has found a suitable replacement (or knows
the more detailed parameters) for Kenwood's SO-1 TCXO. They are
about impossible to find and are likely very similar to off the shelf
TCXO's that can be found for fairly cheap these days. I know the
frequency is 20MHz and the package size, but not the output signal
type. Were detail spec sheets ever available? I wouldn't mind being
able to add one to my TS-940 if I can get the details and I'm sure
others would be attracted given the fairly inexpensive price.

73,
Chris, N9WIV

This seems to be a common problem with the 450/850. When I used a TNC
with my TS-850S in AFSK, my audio was distorted. I think there might be
a fix for it. It was documented by Kenwood as a problem early on. It
isn't an issue with FSK but of course you are stuck with RTTY.

Never seems to be a problem with my TS-870S.

Thanks, John -- got it!

I fell into the same trap I've done before: making my search criteria too well-defined, too narrow. Both Mouser and Digi-Key sell the part at a very reasonable price.

Kenwood has discontinued the YM6631 DDS chips and is rationing what little inventory they have.

Also I need to locate a source for the main processor for the TS850. It also has been discontinued. A search shows a lot of the suppliers supposedly have them in stock but I don't need $250 worth which is the usual minimum order.

The IC is a UPD78C106-36 which does not have an internal rom so it doesn't have to be programmed.

Any ideas???

Clif

Clif, I'm on medication today for the flu so I might not make sense......how much is the main processor? I would imagine if you told us we might need them eventually, you could get enough subscribers here to pitch in so we meet the $250 minimum, get you your stock and have something on hand for each of us in case???????????

Are you talking about two different items here......the YM6631 chips and the main processor or are they one and the same??????

Hi all,

I am new to this group having just joined last night. I am having a little problem with my TS-850 that I have owned and has run flawlessly since 1994. The ALC voltage would seem to oscillate over a period of a minute or two from max meter to normal. If I applied full power the power output would fall to minimum as the ALC voltage climbed up to maximum and then would return to normal of about 100 watts in a few seconds. I determined that the problem was the on the DC-DC board as described by ON7GO on N6TR's website. I changed R2 and R3 from 22k to 18k as suggested and the ALC is now stable. However, the RF output was very low. SO... I adjusted VR7 on the RF unit as per the service manual, item 25 on page 103. This adjustment was on 14.2 Mhz and I was able to get the RF up to 100 watts out with the ALC reading normal. BUT . . . . on 3.800 MHz the RF out is low and not near the 100 watts obtained on the other band. More like 30 watts. with the ALC mid-scale.

This is as far as I have gone but it indicates to me that I need some more alignment and thought that I would seek some new advice before digging in any farther. Does anyone on the group have any suggestions?

Also, let me tell you . . those SMD resisters are small and it is no easy job replacing them with discrete 1/4 watt resistors!!! But I got the job done and the board looks neat.

Hope someone out there can give me some advice.

Tom

Two different IC's. The only way I've seen the main processor fail is the I/O ports to the serial port. Everything else is fine but I've seen this failure several times. As long as you don't need computer control you will never know about it.

I am hoping someone has an in at one of the suppliers that has them in stock, I don't need but 2-3...

I found this Web Page
http://www.hkinventory.com/public/OfferInventResult.asp?
Order=1&pnums=YM66312+&crit1=&crit2=&category=&product=&keywords=&word
s=3&country=&postdate=&brand=&crit3=&crit4=0&datecode=
That shows the DDS chip and who has them in stock as for the main
Prosser well that is a differnt story.

7664. CW TX "dead" - is this a dreaded DDS chip failure?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-02-23 22:51:43 UTC
From: w8nf
Topic: 7664 Message: 7664

My '850 has ceased CW transmit. SSB is fine. But on CW, when I try to TX, the result is a fairly broad hash-like signal that tunes with the VFO knob. Low enough power output that it registers nothing on the front panel power meter. CW sidetone sounds normal. Receiving the rig on an adjacent receiver shows it to be hash.

Is this a symptom of a dreaded DDS chip failure?

I'm guessing, since those DDS chips have been unobtainium for something like ten years, the only solution is to find someone who's parting out a rig?

The problem is they are all in China. I won't buy from China, again.

I bought some 2SC3133's from China for the 870/950. They had a Mitsubishi mark (sorta) on them but the date code wasn't in the right place and they were physically bigger than Mitsubishi parts. Long story short, they didn't work. Period. The B-E breakdown voltage is spec'd at 35v min. These broke down and shorted at 10v. hard to make them work when the supply is 15v.

No China for me.

Thanks for trying....

Yes. The TX light illuminates, the RX mutes, and it DOES transmit -
just broadband hash instead of a CW signal. The hash amplitude does
vary with the CAR level.

Hi Tom,
I am having the same problem with the unstable ALC of TS-850, but I have not yet performed the modification of the DCDC-board as proposed.
You said, you have changed the resistors on the DCDC-board. Did this give you the required -6Vdc output on DCDC-board?

I wonder, because if the DCDC is ok again, there should not be any realignment necessary.

Hi all,

I am new to this group having just joined last night. I am having a little problem with my TS-850 that I have owned and has run flawlessly since 1994. The ALC voltage would seem to oscillate over a period of a minute or two from max meter to normal. If I applied full power the power output would fall to minimum as the ALC voltage climbed up to maximum and then would return to normal of about 100 watts in a few seconds. I determined that the problem was the on the DC-DC board as described by ON7GO on N6TR's website. I changed R2 and R3 from 22k to 18k as suggested and the ALC is now stable. However, the RF output was very low. SO... I adjusted VR7 on the RF unit as per the service manual, item 25 on page 103. This adjustment was on 14.2 Mhz and I was able to get the RF up to 100 watts out with the ALC reading normal. BUT . . . . on 3.800 MHz the RF out is low and not near the 100 watts obtained on the other band. More like 30 watts. with the ALC mid-scale.

This is as far as I have gone but it indicates to me that I need some more alignment and thought that I would seek some new advice before digging in any farther. Does anyone on the group have any suggestions?

Also, let me tell you . . those SMD resisters are small and it is no easy job replacing them with discrete 1/4 watt resistors!!! But I got the job done and the board looks neat.

Hope someone out there can give me some advice.

Hi Mike,

Yes - the 6 volts were right on. My stupidity exposed itself when this morning I again got back to the rig and realized that I had not retuned the antenna tuner and it was still loaded for 20 meters rather than 75. Everything appears to be working normal now. Thanks for the concern.

The toughest part of the repair is removing the SMD resistors and getting a full sized 1/4 watt to fit in their place. I didn't remove the DC-DC board from the RF unit and chose to work on it while still installed on the RF unit. It is delicate work but not that difficult. Go for it. My ALC settled down to normal now.

Thanks

Tom

Tom,

I've no advice to offer regarding the ALC/power issues, but rather selfishly have a question instead: How did you go about removing the DC-DC converter board to change the resistor values? Did you cut the PC-board pins?

Those SMD resistors are indeed small -- unbelievably small when viewed without eyeglasses aided by magnifiers capable of identifying male flies from female flies on the moon... Stabilizing the motion of the soldering iron is another matter.

The CW sidetone signal is generated by the same DDS chips that
generate the actual transmitted signal. If the sidetone pitch is 20Hz
off what you expect it to be, then the TX signal will be off by the
same amount and you'll be zero beat.

Unless it's some other osc in the rig in the TX chain that's off freq.

Look at the block diagram in the service manual - it's incredible how
they did the frequency conversions in the rig.

I'm trying to identify -- and get the part number for -- the male coaxial-cable connectors that are used for the TS-850 board-to-board interconnecting cables.

Are those connectors available?

Has anyone successfully removed and reused the connectors? They appear to be crimp connectors, which to me would negate their reuse.

73,

Paul / N1FB

From: Crownhaven
Topic: 7679 Message: 7679

This is the tuner that LDG has designed to replace the Kenwood AT-300 that is discontinued. It is an outboard tuner for the TS-450/850 among others that is controlled from the front panel of the radio. I recently acquired one and it works great. It comes with the control cable that plugs into the back of your Kenwood as well as a coax jumper. No external power source is needed. It is powered by the radio. The only difference between this tuner and the internal tuner, that I can see, is it does not display the SWR on the radio's meter as it is tuning. You simply get a red light on the front of the tuner and then it turns green and turns the rig back to you in receive mode. It tunes VERY fast and appears to offer a wider range of tuning than the internal tuner. It is very small, just a little larger than the palm of your hand. Light as a feather. I needed a tuner for one of my TS-850s and couldn't find the internal tuner. This looks like it might be a better choice. Your mileage may vary.

I have a note somewhere saying that they are called MM connectors.

With all the parting out of radio's nowdays I bet there are a few
used ones floating around.

I never have seen the crimper for these and have always wondered how
they are crimped as it's not the typical hex or roundcrimp.

I came up with a few numbers:

RFM-2100-1 Plug
RFM-2102 PC Mount (vertical) Socket
RFM-2102-1 and RFM-2102-2 45 degree PC-Mount

I am almost sure these are the ones used on the Kenwood and ICOM
radios. I have also seen them used in the Realistic PRO-2004 2005
2006 series of scanners.

Thanks for the information, Ed.

The crimping method is something I've not seen elsewhere; perhaps it's indigenous to the Asian market.

Tom,

I've no advice to offer regarding the ALC/power issues, but rather selfishly have a question instead: How did you go about removing the DC-DC converter board to change the resistor values? Did you cut the PC-board pins?

Those SMD resistors are indeed small -- unbelievably small when viewed without eyeglasses aided by magnifiers capable of identifying male flies from female flies on the moon... Stabilizing the motion of the soldering iron is another matter.

Hi all,

I am new to this group having just joined last night. I am having a little problem with my TS-850 that I have owned and has run flawlessly since 1994. The ALC voltage would seem to oscillate over a period of a minute or two from max meter to normal. If I applied full power the power output would fall to minimum as the ALC voltage climbed up to maximum and then would return to normal of about 100 watts in a few seconds. I determined that the problem was the on the DC-DC board as described by ON7GO on N6TR's website. I changed R2 and R3 from 22k to 18k as suggested and the ALC is now stable. However, the RF output was very low. SO... I adjusted VR7 on the RF unit as per the service manual, item 25 on page 103. This adjustment was on 14.2 Mhz and I was able to get the RF up to 100 watts out with the ALC reading normal. BUT . . . . on 3.800 MHz the RF out is low and not near the 100

watts obtained on the other band. More like 30 watts. with the ALC
mid-scale.

This is as far as I have gone but it indicates to me that I need some more alignment and thought that I would seek some new advice before digging in any farther. Does anyone on the group have any suggestions?

Also, let me tell you . . those SMD resisters are small and it is no easy job replacing them with discrete 1/4 watt resistors!!! But I got the job done and the board looks neat.

Hope someone out there can give me some advice.

Tom

Topic: 7451 Message: 7685

with TS-850 distortion mostly happens due to rf ingress from the rear tnc connector (AFSK-in).

However, very similar effects are obvious, if voltage of 13,8V power supply is dropping due to poor contact at connector.
If you just have 0,1 Ohm additional resistance at that old Kenwood type power supply connector of the rig, you will loose more than 2 Volts at transmit
which could cause the finals to produce severe rf distortion. (0.1Rx20A=2V)

By the way, it also often causes the so called "ALC issue" of TS 850 DCDC-board,which will not work correctly at low dc voltage.

Just as a wild guess, might there be an RFI issue?

I live on a postage stamp lot and run power, with 75 and 40 dipoles not too far overhead. Had RF getting in the on the mic.

I now have a Rig Blaster Pro with torroids on the internal mic jumpers and in the past, before rig blasters, a torroid on the mic cable. Which seems to have solved the problem.

By the way I am using 77 mix torroids FT 240, 140 and ½ inch.

Paul - N1FB

I'm sorry that I didn't see your query when you sent it or I would have replied sooner. Only today did I realize that you had asked me a question on the 24th.

Yes, the resistors are indeed small. When I repaired my ALC issues I removed the RF unit but did not remove the DC-DC board from the RF board. I clamped the RF board in a PC board vise that I have and got out my trusty magnifier glasses. Removing the SMD resistors without damaging the board is probably the most difficult part but not that hard. I used a little solder wick to soak up the excess solder and then used a big needle under the resistor to lift it from the board as I heated it with the iron. There is room to work on the DC-DC board if you hold it at just the right angle and the vise really helps. Heating the resistors with a little pressure from the needle lifts them right off then board and then the traces can be cleaned up. I then replaced them with 1/4 watts by cutting the leads real short and soldering them to the traces. They look rather large and out of place but fit just fine and the works great. I had considered just paralleling a resistor to give me the required 18k but choose this route instead. Rig has been working great since.

Hope this helps

It will not work. A -6V voltage regulator will not produce
-6vdc from a +13vdc source. If you feed it a -13vdc it will
provide you a -6vdc output. The DC to DC board is taking the
+13vdc input and switching it into an AC voltage then rectifying
it and regulating a -6vdc output. I wish it was as easy as
replacing the stock part with a 3 terminal IC VRegulator.

watts in a few seconds. I determined that the problem was the on the
DC-DC board as described by ON7GO on N6TR's website. I changed R2 and
R3 from 22k to 18k as suggested and the ALC is now stable. However,
the RF output was very low. SO... I adjusted VR7 on the RF unit as per
the service manual, item 25 on page 103. This adjustment was on 14.2
Mhz and I was able to get the RF up to 100 watts out with the ALC
reading normal. BUT . . . . on 3.800 MHz the RF out is low and not
near the 100 watts obtained on the other band. More like 30 watts.
with the ALC

Use a 7660, it takes +12v in and creates -12v, then regulate down to -6 with a LM337.

Subject: [TS-850_450_690] Re: ALC issues

It will not work. A -6V voltage regulator will not produce

-6vdc from a +13vdc source. If you feed it a -13vdc it will

provide you a -6vdc output. The DC to DC board is taking the

+13vdc input and switching it into an AC voltage then rectifying

it and regulating a -6vdc output. I wish it was as easy as

replacing the stock part with a 3 terminal IC VRegulator.

I am selling my TS-450 and Inrad 500hz CW / 455IF filter. Both are listed on ebay if anyone is interested.

I love the TS-450 dearly but did want some of the features of the newer models. I obtained a Yaesu FT-920 and so far so good.

I operate mainly CW so the 920 suits my needs but it is nothing on phone compared to the TS-450.

TS-850 RF Cable and PC-Board Connectors

After some searching, I've found that the RF connectors used in the TS-850 (and other radios such as the Elecraft) are of the TMP series. The following link directs your browser to Spectrum Component Sales, Inc:

http://www.scsiglobal.com/

At this site, you can locate PDFs describing the connector series, the crimp tools used for the cable connectors, and instructions on how to prepare the cable for attachment to the connector. The PDFs are listed on the Applications Specific Connector page which is the first item under Coaxial Cable Connectors in the page table:

http://www.scsiglobal.com/Vendors/Taiko_Denki/td_application_specific.htm

The crimp tool PDF link is:

http://www.scsiglobal.com/Vendors/Taiko_Denki/S34handtools-s.pdf

The PDF describing how to prepare the cable for attachment to the connector is located here:

http://www.scsiglobal.com/Vendors/Taiko_Denki/TMP%20Recommended%20Cable%20Assembly%20with%20TD%20Original.pdf

From that PDF, it appears that the CH-204-2A crimp tool is the one to use for RG-174 and some of the other smaller coaxial cables such as RG-178, RG-188 and RG-316. The quote I received from SCSI for the crimp tool is $780 plus shipping. (Soldering the coax to the connector is much less expensive for hobbyists!)

Unfortunately, my inquiries regarding small-quantity purchases of the TMP connectors have gone unanswered.

A posting by Petr, OK1RP, regarding his attempts to secure some of the TMP-K01X-A1 connectors for an Elecraft transceiver is posted here:

http://www.mail-archive.com/elecraft@.../msg62437.html

Hi Bob,

Assuming certain similarities to the TS-850S, I would check all the diodes in the receive bandpass filter switches, along with the obvious things you mention. You also might take a signal generator and insert a signal in the receiver chain to determine how far up the chain damage has occurred.

In my opinion there is no reason to part out that rig. It shouldn't be too difficult to fix.

7705. a strange startup problem with TS-450s

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-03-19 15:47:26 UTC
From: ok1vaw
Topic: 7705 Message: 7705

Hello,
I am new member of the group, owning and using successfully the TS-450s for a few years without any problems. Short time ago a strange behavior appeared on it. After switching the transceiver power on, the receiver is muted (has no audio) on LSB, USB and CW modes, in the AM and FM it is receiving properly.

When trying to send with the transmitter, there is no transmitted power on all modulations on the output, no power indication on the display. The antenna tuner does not work too in this situation, it freezes with both LEDs on.
This state take now about 4minutes and after that the radio awakes and works after that hours properly. The returning to good state is immediate, without any noises or distortion on the receiver output.I have listened on the second receiver.

I have the service manual and suitable measurement equipment. After my manual studies I came to conclusion, that it could have something to do with the 455kHz signal or CAR board, but I have not opened and measured it yet, the 4 minutes is quite short to find something.

On different formus there are infos about some shifted VCO frequency problem and something about problems with the DDS, which are typical for TS-450s, 690s and 850.

I would be very happy to hear something from somebody, who maybe solved a similar problem on this very nice radio and knows the radio bad sides...

Best regards and thanks in advice for any info,
OK1VAW, Vojtech.

Thanks, Dave.

I'm aware of the resistor values mentioned. I was looking for the RM-1 schematic itself. Clif's pointer to the TS-950DX Service Manual has provided the answer.

The only real known problem I know of is the internal battery that holds frequency in memory. They corrode really bad & can cause problems with foil on circuit board even though battery is still good. I took a look at mine a few years back and sure enough it had already started to corrode.

Since it is solder to circuit board I clipped the terminals on the battery & solder a external battery holder. Taped it up & found a empty space to store it I believe next to tuner.

That may not be your problem, but while you are in there I would check that battery.

Hi All

I had this a while back on my TS-690 after not using it for a good few years. After poking around the 455KHz circuit checking the voltages, I eventually found the audio output capacitor had blown its top and some of the electrolyte was deposited on the PC board. This seemed to have got into the thru-hole plating and cause mayhem with the RF gain control of the IF amp which sits close by. The s-meter would read as if the rf gain on the front panel had been turned right up deflecting to over S9. Initially it would drop down gradually after about an hour once the set had "warmed up". I cleaned the board thoroughly with some switch cleaner and left it out in the sun for a day to dry out any electrolyte and switch cleaner. It has since performed flawlessly with a new audio output cap.
Hope this helps....check those caps.

Regards

Rob ZS5LA

--- In TS-850_450_690@yahoogroups.com, Rob Cohen <robzs5la@...> wrote:
Hello to all!
Thanks to all replying to my theme. I have opened yesterday the radio, found the CAR board and begun to make some initial measurements with my spectrum analyzer on it. The DDS I have there are dated 1990. When the SSB and CW is not working (muted), the -+455kHz output from the YM6631 is exactly on double frequency (910kHz) with some spurious around, the amplitude seems to be correct. After some time (4-6minutes) it changes immediately to correct frequency and all seems to be okay. I have tested the input 20MHz clock to CAR board, which seems to be okay, so maybe there are two circuits which are shaping the 20MHz to both DDS, I have measured 2V DC in place of 2.5V, the amplitude was not tested. But the second DDS works well, so all evidences and my deductions still points to the YM6631 DDS fault.
So looking forward to your opinions and thanks for other posts,
Best regards,
OK1VAW, Vojtech.

7715. GREAT TIP!! (was a strange startup problem with TS-450s)

Wow what perfect timing for a great tip. I just bought a TS-690 to strip for RF parts to fix my TS-450. Looks like I can fix the TS-690s alot easier! And gain 6 Meters

Still need a working band pass board for the TS-450s

7716. Sale: TS850SAT spares/repairs

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-03-24 16:15:32 UTC
From: MM3XXW
Topic: 7716 Message: 7716

Thought I'd pop this on here to give you guys a chance before I put it elsewhere.

Anyway up for grabs is my TS850SAT with matching SP-31 and MC-80.
I've headed this spares/repairs as it is in need of repair by someone more experienced than I.

Now although I say spares/repair this unit is still fully-functioning and is in daily use (wouldn't take much to pop it right back on course I think) however there are one or 2 minor foibles which I will fully explain to any interested parties together with pictures of all equipment offered.

All the boards are fine (inc the carrier board) and there's no leaky caps, cosmetically it's in very good nick for it's age (serial 30200689)as are the other items but it would benefit from a really good service.

I'm looking to fund a mobile radio, IC-703 or likes, as I wish to start operating portable again but 'shack manager' says I can only operate one radio at a time!!!!

Be happy to answer any and all queries.

Regards,
Martyn

Shaun,

Should you decide not to have the TS-850 repaired (it's a great rig), and decide to part with it, take the time to list the problems you're having with the rig. Identify which, if any add-ons are included: filters, DRU-2, VR-2, etc, and which accessories you have. Determine if you want to sell items separately, ie, "part it out," from internal components such as PC boards, filters, the Final Unit, knobs, front and rear panels, etc. Take good-quality pictures of the pieces. Then you can offer the rig and accessories as an "organ donor."

But, I'd encourage you to seriously consider having Clif repair it. He can determine whether or not the rig is worth the cost of hospitalization and surgery.

Thought I'd pop this on here to give you guys a chance before I put it elsewhere.

Anyway up for grabs is my TS850SAT with matching SP-31 and MC-80.
I've headed this spares/repairs as it is in need of repair by someone more experienced than I.

Now although I say spares/repair this unit is still fully-functioning and is in daily use (wouldn't take much to pop it right back on course I think) however there are one or 2 minor foibles which I will fully explain to any interested parties together with pictures of all equipment offered.

All the boards are fine (inc the carrier board) and there's no leaky caps, cosmetically it's in very good nick for it's age (serial 30200689)as are the other items but it would benefit from a really good service.

I'm looking to fund a mobile radio, IC-703 or likes, as I wish to start operating portable again but 'shack manager' says I can only operate one radio at a time!!!!

Be happy to answer any and all queries.

Regards,
Martyn

I have used Clif for numerous repairs of vintage Kenwood HF and VHF.
First class service. Responsive, quick and VERY reasonable prices.

Shaun,

Should you decide not to have the TS-850 repaired (it's a great rig), and decide to part with it, take the time to list the problems you' re having with the rig. Identify which, if any add-ons are included: filters, DRU-2, VR-2, etc, and which accessories you have. Determine if you want to sell items separately, ie, "part it out," from internal components such as PC boards, filters, the Final Unit, knobs, front and rear panels, etc. Take good-quality pictures of the pieces. Then you can offer the rig and accessories as an "organ donor."

But, I'd encourage you to seriously consider having Clif repair it. He can determine whether or not the rig is worth the cost of hospitalization and surgery.

Shauney,
Do like I did take the Car board out and sent that to Clif. He will replace the caps and bad DDS chips and if he has a 850 in the shop test it. When I did that he did not have a 850 in for repair but when I placed the repaired CAR board in my 850 it worked like new again. It cost a lot less in shipping that way. It saved me $250+ in shipping costs. Be sure to contact him first though. Clif is the best out there for Kenwood repair and his rates cant be beat.

Hi Shaun,

Distance problem recognized.

My old (2 M S/N) TS-850 developed the Carrier Board leaking-capacitor problem which Clif repaired. Fortunately, the DDS chips didn't require replacement.

During 2008, on a couple of occasions, I've seen Carrier Boards offered on eBay by TS-850 owners who were parting out their transceivers. Understandably, those boards sell quickly.

A suggestion: If you feel the problem(s) you're experiencing with your TS-850 are confined to the Carrier Board, consider removing the board from the transceiver and having it repaired by Clif or someone else. Shipping charges for the board alone would be far less than those for the entire transceiver.

The DDS chips are discontinued. If you want them replaced on a board you have to supply them.

7728. Snap Crackle and Pop

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-03-26 22:17:40 UTC
From: Tony roskilly
Topic: 7728 Message: 7728

Hi,
I got a pal who is a genuine radio technician to do the sidetone mod for the TS-850S, ie allowing the Monitor control
to be used to vary the sidetone level. I was delighted to have the new facility on the front panel unfortunately I now
have a snap crackle and pop noise which is progressively worse as I advance the Monitor control, its quite annoying when
wearing headphones. I've tried remaking the solder connections and tried setting the yellow preset pot inside the rig to
a different place on its track in case it was an iffy bit of track when we set it after the mod. Has anyone else come
across this problem please?
thanks
Tony G3ZRJ

7734. My TS-850SAT Panel Display

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-03-29 13:50:27 UTC
From: Tom
Topic: 7734 Message: 7734

First off - a picture of what my display looks like can be seen at, http://tommywhitewolf.hostse.com/TS-850SAT-Panel-W8BNL.jpg.

The radio is otherwise completely functional and I am using HRD to handle frequency and band switching tasks. Everything to the right of the "Meter" section of the panel is a mess and unreadable. It also will change appearance as you change frequencies or push any buttons. Again, that is why I am using HRD for control.

I am currently unemployed and can't afford to replace this radio. No savings or other funding available either, so I am asking if anyone out there could either walk me through some possible fixes, or could offer any other help as this is my only HF rig.

Oh yea - I have opened the case and made sure that all boards and cables (that I could get to) are properly seated or re-seated.

Thanks in advance. W8BNL - Tom

From: Shauney@btinternet
Topic: 7716 Message: 7738

Hi Paul N1 fb Thanks for the advice,ive no way of checking the chips you could be right maybe they are ok.Having read about these issues i believed it would be best to change the chips,but like clif said these are discontinued.I did buy another board on ebay to try and it worked,and after a short time it failed again,so ive got another fault somewhere on the set.Ive seen boards on ebay go for 119 pounds,and no working radios going for 300.Hold on to it paul you have a very sort after classic radio.

73s Shaun G0LMF

The DDS chips are discontinued. If you want them replaced on a board you have to supply them.

Gentlemen, I'm so sorry because I only have 8 chips left
and I have problem to trade this chips because:
1. I live in Indonesia and I don't have any International
account only Indonesian' govt bank acc.
2. I don't have any idea for the price. Please let me know
how much rational price for each chip.

Gentlemen (especially Shauney, Steve Hound, Ronald Starr,
Tracey Gardner, Vojtech Klusacek), thank you for your kind
attention

Best regards

Win

Is $15.00 USD per chip acceptable?

How much for shipping?

Where would I send funds?

Western Union is located in Indonesia. What City do you live in? They require a street address, postal code.

My shipping address

John Parker

Center for Health Studies

Subject: Re: [TS-850_450_690] Re: Sale: TS850SAT spares/repairs

Gentlemen, I'm so sorry because I only have 8 chips left
and I have problem to trade this chips because:
1. I live in Indonesia and I don't have any International
account only Indonesian' govt bank acc.
2. I don't have any idea for the price. Please let me know
how much rational price for each chip.

Gentlemen (especially Shauney, Steve Hound, Ronald Starr,
Tracey Gardner, Vojtech Klusacek), thank you for your kind
attention

Best regards

Win

Is $15.00 USD per chip acceptable?

How much for shipping?

Where would I send funds?

Western Union is located in Indonesia. What City do you live in? They require a street address, postal code.

My shipping address

John Parker

Center for Health Studies

1730 Minor Avenue, Suite 1600

Seattle, WA 98101 USA

73,

John KD7KFT

Clif,

I have an older TS-850 with the older chips, but have never had a problem (rig is over 18 years old). I don't think you need to replace them unless there are issues with them. A lot of the older chips work fine. Only certain ones had issues. Is it your recommendation to replace them anyway?

Mike, N4GW

My first rule of thumb: "If it ain't broke, don't fix it"

Check for leaking caps and batteries, sure, and if they're leaking (broke) replace them.

Mine had all the caps and battery replaced at the end of last year. I think it will be good for many many years

Topic: 7755 Message: 7755

A good rule of thumb, Clif!

I hereby deposit my 2 cents:

I encourage *all* TS-850 owners to closely check the CAR Unit (X50-3140-00) PC board for signs of capacitor leakage unless you know the capacitors are good or have been replaced. The most well-known eight (8) bad actors are C8, C10, C13, C15, C20, C22, C25 and C27. In some cases, the leaking electrolyte may be difficult to spot -- it may be concealed beneath the capacitors themselves.

My older 2-M serial number TS-850 was repaired by Clif a couple of years ago. The rig's CAR Unit leaky capacitors had made a mess. Recently, while tracing an AGC problem in another TS-850 -- a much younger TS-850 with a 7-M serial number -- I decided to check the CAR Unit. Sure enough, inspection showed one wet-looking area, Further checking revealed another wet area. Then I spotted three (3) other of the bad boys who sported dull, rough-looking leads, appearing much like cold solder joints: the effect of the electrolyte eating away at the soldered lead. One capacitor's lead was so corroded that simply touching the capacitor body broke the lead. Around those capacitors were no wet areas -- but *beneath* the capacitors' bodies I found the oily electrolyte.

Chances are you'll need to use a magnifying glass, eye loupe, headset magnifiers and eyeglasses when inspecting the board.

I've attached a couple of photos of that CAR Unit PC board.

73,

Paul / N1FB

My first rule of thumb: "If it ain't broke, don't fix it"

Check for leaking caps and batteries, sure, and if they're leaking (broke) replace them.

Clif

lot of the older chips work fine. Only certain ones had issues. Is it your recommendation to replace them anyway?

Point well taken! Wonder if anyone has a recommendation for a source(s)
and perhaps type/brand of replacement caps for peace of mind. Have a couple of boards to update with fresh caps and battery holders.
Thanks for the help!
Ron K0OXB

(Snip)..I encourage *all* TS-850 owners to closely check the CAR Unit (X50-3140-00) PC board for signs of capacitor leakage unless you know the capacitors are good or have been replaced.

A couple of years ago I used Mouser:

647-UUD1E470MCL - 47uf, 25v qty 1
647-UUD1E220MCL - 22uf, 25v qty 10 (Mouser didn't have 10uf in stock)

There are some gory photos of dead caps and repairs on
http://www.zievid.com/W6OT/TS-850/TS-850.htm

I did a pretty through search on the web and didn't find any. Those warehouses with the min order of $300.00 says they have them. I don't believe pacparts has them. I have had this problem in the past where they indicate they have it and I get a phone followup that it's no longer carried.

I tend to believe Cliff since he's been around the block a few times reparing these things.

John

Is $15.00 USD per chip acceptable?

How much for shipping?

Where would I send funds?

Western Union is located in Indonesia. What City do you live in? They require a street address, postal code.

My shipping address

Hello Gentlemen

Sorry for late answer. I have to go to Borneo this evening and next Saturday will be back to Jakarta.

Thank you all for email and attention. I surprised for all response (too many proposed for 8 chips). Once again thank you very much

See you next Saturday because I don't think I will have internet facility there in Borneo

Best Regards

Win

Not that it makes much difference at this point, but I believe that the YM6631 is the older version of that DDS IC -- the later version is/was the YM66312.

Hello,
as far as I have a two weeks ago got in the same problem with a need of YM6631, I spend a lot of time to get it.
There is at least one company in USA which has still stocked YM6631 (about 45USD), but concerning the YM66312, I have found only few offers (around 400 pieces) from Asia and mostly those companies want to sell the whole lot and for a few pieces there was no response.

It is quite important to take in account a risk, that the component from outside Kenwood network could be a fake (as far as what is needed will be faked), so it needs a quality test or some similar check before buy. I have met with such a thing with some processors from China and it was a very unpleasant problem. The top of the component seen under the microscope was brushed to delete old laser marking, than a new coating was added and new laser description....without a detalied inspection practically invisible.

If you need a few pieces as a private, it has no great use to buy 100, but on the other hand a person, who repairs the radios often for other people could do that.

I personally want two of the YM66312, so if somebody find a serious small quantity source, please let me know.

Hi all, I have built an interface to control the radio with HRD. It works fine but if I send data from HRD to radio they are sent immediatly and the radio follows the tuning of HRD on the same time. If I tune the radio the data changing are sent after 1 second, more or less. If I tune the radio fast the data are not sent (and HRD send an error)until tuning is stopped. This is not a big trouble but with other radio (IC751 and piexx interface) the effect doesn't appears.

I have noticed the same issue with my TS-850. If I continuously turn the VFO, my rig control software will loose its connection. It appears the 850 oonly send CAT information when the radio is idle. Not a big issue, but probably just the way it was designed

Hi Vojtech,

I got a chuckle out of your comment on your Web site regarding the 2-m amplifier you built: "bombenfest und idiotensicher" -- (bombproof and idiot safe)!

Regarding your e-mail referring to the YM6631 ICs: Can you provide the name of the US company that supposedly has some of those in stock? Perhaps one or more of the group members would be interested in further investigating that lead. Maybe there's a way to determine if that company is one that can be trusted to deliver the proper goods.

73,

Paul / N1FB

Hello,
as far as I have a two weeks ago got in the same problem with a need of YM6631, I spend a lot of time to get it.
There is at least one company in USA which has still stocked YM6631 (about 45USD), but concerning the YM66312, I have found only few offers (around 400 pieces) from Asia and mostly those companies want to sell the whole lot and for a few pieces there was no response.

It is quite important to take in account a risk, that the component from outside Kenwood network could be a fake (as far as what is needed will be faked), so it needs a quality test or some similar check before buy. I have met with such a thing with some processors from China and it was a very unpleasant problem. The top of the component seen under the microscope was brushed to delete old laser marking, than a new coating was added and new laser description. ...without a detalied inspection practically invisible.

If you need a few pieces as a private, it has no great use to buy 100, but on the other hand a person, who repairs the radios often for other people could do that.

I personally want two of the YM66312, so if somebody find a serious small quantity source, please let me know.

The same happens to me.

Maybe it's because the data rate is only 4800 bits per second, I think, :-(((

I use the cat cable from ZLP Electronics.

It doesn't matter what the polling rate is, if the tuning dial on the TS-850 is continuously turned it will not communicate over the serial port. The microprocessor in the TS-850 cannot communicate over the serial port while the tuning dial is actually being turned. You have to tune the radio in short bursts, leaving the dial fixed for at least a short time every so often in order to allow the radio to communicate with the computer. Changing the polling rate may affect how long these bursts are and how often and for how long you need to stop turning the dial, but it will not allow you to turn the dial continuously without losing communications with the computer.

I agree with you. Probabily this is normal in TS850 rig and no solution are available for faster the transfer rate from radio.

Hi - I have an TS-850S and had two power related questions.

1. Is the molex power plug from the TS-450s the same as the TS-850?

2. Is a 13.8 volt 20 amp supply ok to use to do you need a high rating on the amperage for the TS -850S?

Thanks for the help.

Aloha Norm,
The 850 draws 21 amps in transmit if you are using SSB only the 20 amp will work but if you do digital (CW,RTTY ect) Get a 25amp PS.
And the Molex is the same for all kenwood 12V HF Rigs except the TS-480. Enjoy the 850 Great Rigs.

Date: 2009-04-05 21:38:15 UTC
From: bzkroby
Topic: 7778 Message: 7778

Hi all, another question. I have done all the modify concerning the display (replacing C18, measure the continuity of 8V power line etc.)
but the problem still remain. Ater more than one day of radio stop at the first power on the display remain unpowered,not all day, (black). At the second of third push on the display retourn to operate correctly. They are solutions or it is normal?
Thanks for any answer.
Roby, I3BZK

Gentlemen, if I recall correctly, the connector is not quite a Molex -- similar, but a bit different somehow. You want to ensure the pins engage firmly at the currents involved. One size of Molex pins or sockets does not fit tight, as I recall. No reason not to squeeze them a bit to ensure they are tight if there's any doubt as to their fit.

I have found when buying a non-OEM power connectors (MOLEX brand?)that the sockets are about 7 thousandths of an inch too large and will not make a solid contact with the original Kenwood ICOM power pins.

I bought a non OEM conector at a Hamfest and another one off ebay and so far no luck yet on getting one with the proper fit. They intermittently make contact and are too large(sockets).

Someone else on another related yahoo board said the ICOM Kenwoods connector was a metric size / fit and that may be the case.

I have swapped OEM Power cables between a TS-850, TS-450, 756PROIII and a 746PRO and never had a problem so I tend to think those socket/pin sizes are the same with those OEM power cables and radios.

As for the fusing amperage I never examined the sizes and you may want to be sure of that. I mainly do listening here with my rigs and am tied up on the work bench most of the time!

I saw the sockets available from the company that makes powerpoles and was wondering if it is the proper size? It might be since it's from a reputable source.

I was looking at the Inrad web page yesterday and saw that they have in development a Roofing Filter Kit for the 850 that is being tested.
"Our new TS-850 Roofing Filter Mod is currently in field test. We will make an announcement when it goes into production. (Feb 20, 2009) " This is great News for us 850 owners I cant wait for it to come into production I have been wanting to experiment with the 950 roofing kit for a year or so but now with this news I'll wait a while longer. Lets hope it comes out soon.

I just received my TS-850SAT today.

I need a power supply for it.

I do have a mint condition PS-53 from my TS-450SAT. It's rated at 13vdc, 22amps. The PS-52 for the TS-850SAT is rated at 12vdc, 20 amps.

Can I get away with just using the PS-52?

Date: 2009-04-06 19:55:24 UTC
From: parkjv1@comcast.net
Topic: 7782 Message: 7784

If I can use the PS-53 then I won't sell that with it. But it does come with a new SP-23? Sorry, I'm at work and don't remember. It comes with two filters, SSB and CW.

I have all of the original boxes, paperwork. I'm the 3rd owner and I haven't used it. I don't have an antenna yet.

It has been used lovingly in the past and shows pride of ownership and doesn't have a scratch on it!!!

Looks like it was manufactured yesterday.

I will consider all offers + shipping and will take pics and have them available for those interested.

I take paypal but will accept a check if paypal doesn't work for you.

Subject: [TS-850_450_690] Power Supply for the TS-850SAT

I just received my TS-850SAT today.

I need a power supply for it.

I do have a mint condition PS-53 from my TS-450SAT. It's rated at 13vdc, 22amps. The PS-52 for the TS-850SAT is rated at 12vdc, 20 amps.

Can I get away with just using the PS-52?

73,

John KD7KFT

From: kremper4-850@yahoo.com
Topic: 7787 Message: 7787

Hi Vojtech,

Unfortunately, the listing at that Web site regarding the availability of the YM6631 is incorrect. The YM6631 and YM66312 are no longer available from Kenwood, either. The manufacturer that supplied those ICs for Kenwood has discontinued production. There had been some traffic in this Yahoo group regarding the unavailability of these ICs, but on your behalf, I decided to check.

I had verified the bad news by calling the PartStore.com and asking about the ICs. The representative assured me that their Web site is up to date and that the part (listed at about $46 each) would usually ship in 4 - 6 business days as stated. He suggested I phone Kenwood if I had any doubt about the part's availability and gave me a telephone number, which I verified by repeating it to him. The phone number he gave me is incorrect.

I then phoned Kenwood using the number provided at their Web site: (310) 639-4200. The representative told me those parts are no longer available.

73,

Paul / N1FB

Hello Paul,
I am reacting to your yahoo message, thanks for your compliment to my 2m amp
HI!

Concerning the company, who offers the ym's, it is:
http://www.partstore.com/Part/Kenwood/Kenwood/YM6631.aspx
Unfortunately they seem to be shipping only to USA, so I will be very
gratefull, if you decide to order there for you, to buy one for me and then
resend it by USPS to Czech Republic. I can pay you in advice (as it is done on
ebay) by my Paypal account. The postage by normal USPS is acceptable for such a
small thing, but most companies offers Fedex or DHL with sending cost about
60USD and this I find not to pay off.
I could not do more investigation from overseas, but this source (although a
little bit more expensive than the 28USD by others about half year ago) seems to
be the most serious from the others I found.
Please let me know, what is your opinion,
Regards,
Vojtech, OK1VAW.
In the attachment you have my correspondence with them.

7788. Interesting fuse experience with TS-850SAT

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-04-07 00:33:17 UTC
From: Scott
Topic: 7788 Message: 7788

I've had a 2nd-hand TS-850SAT for about 15 years now. It always maxed out at around 75W or so, and I just figured the guy I got it from had turned the max output down a bit for longevity. Since I generally only used it to drive a 3-1000Z amp I only needed about 50W anyway, so never really paid much worry to it.

Today I needed to do some two-tone testing on a device at +20dBm, and the best combination of gear I had was the '850 and a 30dB/300W attenuator. I figured I'd be about 1.5dB short (since I had only ever seen 75W out), but close enough. Hooked it all up and was monitoring the output on a spectrum analyzer while adjusting the audio levels on the two-tone generator, when suddenly...rig is off!

Went to the Rigrunner panel and nothing wrong there. I remembered that the DC cable from the Rigrunner to the '850 had inline SFE20 fuses, so felt behind the bench and one of the fuseholders was quite warm...odd. So I pulled the cord and replaced the fuse, and looked at the blown one. It had blown in an odd way; not in the middle, but way down at one end, right at the edge of the metal cap. It was hard to see the break with certainly but but the element was oddly bent in the glass and clearly out of whack.

Crossed my fingers and turned the '850 back on...success...and now! I get the full 100W output.

So that fuse was probably always just marginal enough to maintain continuity at 50W, and the short-duration testing I'd occasionally do to verify that 75W was really as good as it could do wasn't enough to shake it up either...but put enough of a voltage drop in the DC line that I could never make the 100W. It took a sustained (1 min+) full-output run to "blow out the cobwebs".
Who'd a-thunk?

Scott,
I just recently had the same thing to mine not just one fuse but both over a 2week time frame. I have been doing the TPA on LoTW so it's RTTY,CW and SSB. Only I do run 100W but only 70W into the amp. I came to belive it was caused by using a 20A power supply not a 25+ amp supply. I had bought a Astron 20A supply and took my 35amp supply out of line to use the astron. The first fuse blew in mid QSO using RTTY and 1 week later the second one went during a PSK QSO. I looked in the manual and saw that it should be a 25A fuse not a 20A so I swtiched back to the 35A supply and replaced the 20A fuses with 25A one and have not had a problem since. On exam the fuses where over heating enough to soften the soldier and have it detach from one end but not blow. So if you are using a 20A supply that might be where the problem lies. The 850 Needs at least 22.5 amps on transmit.

I have found Rig Runner products play havoc with the output on my
various rigs that are sensitive to voltage fluctuations. I haven't
quite figured it out yet though.

Agreed. I was asked to be a field test person, but time and
out-of-state telecom job commitments prevented that.

Let's hope they come up with a winning design. Such a filter will
breath new life into an already GREAT receiver.

I typically us a Shure SM-58 mounted on a desk stand with a foot switch. It's very convenient to use like this as it frees up my hands for typing on the computer and writing in the log book, etc.... However I have a D-104 mike with a Heil HC-5 element in it that gets rave reports from people without even asking for an audio check.

I just "gave" one of my TS-850's to a local ham so he could get on the air, but took all accessories out first.
Not sure if anyone in the group is interested,but these Items
are listed for auction on Ebay.

Kenwood DRU-2, auction # 120402470701
Inrad # 96 2.1kHz,455kHz IF, # 120402474657
Inrad # 94 2.1kHz,8830kHz IF, # 120402476196
Kenwoos YK-88SN 1.8kHz, 8830kHz IF, # 120402479002

Filters are less than a yr old, and the DRU-2 is fully functional.
Thanks for looking

Ray,

My older TS-850SAT (S/N 2M) has the YM6631 DDS ICs in it and it runs fine; the younger rig (S/N 7M) is equipped with the 66312 ICs and it's fine, too.

You *do* want to ensure that the original ten (10) electrolytic bypass capacitors on the CAR Unit board (the board with the YM66xxx DDS ICs) are not leaking. Personally, I recommend that if they are the original capacitors, that they be replaced -- I suspect DDS IC failure is related to the capacitor failure. Clif Holland of AVVid can do the capacitor replacement. There's no need to send the entire transceiver to Clif. Remove the CAR Unit board from the rig *without* removing the PC board from its metal mounting platform, place the assembly in an antistatic bag, put the bag in a shipping carton with a good amount of bubble wrap and insure the package for at least $200.

I suggest you contact Clif before mailing the board. Also, be sure to label the connectors you disconnect from the CAR Unit so you'll feel comfortable about reconnection; that's pretty obvious, though.

73,

Paul / N1FB

You'll be fine with those. That's what I have in mine. But, I think there
some users who have the older chips and haven't experienced any issues.

Topic: 7805 Message: 7805

Hi Guys,I just posted a TS-850S on ebay
<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=260392667982&ssPageN\
ame=ADME:L:LCA:US:1123> .This TS-850 is verified non-functional. The
transceiver has a bad I/O distribution IC on the CPU control unit. The
CAR unit works; I tested it in another 850, but the data going to it is
bad, so that all the DDS chips are either putting out no signal or dirty
signals. The radio is in good shape, cosmetically and has many useful
parts for other radios or could even be repaired. Thanks, Jason KB5URQ

Hi Kurt, is that D-104 with the amplified base or with out, and did
you have to perform any mods to the D-104 to make the Heil
HC-5 element work or to the TS-850? N0KDS Mike

I typically us a Shure SM-58 mounted on a desk stand with a foot switch. It's very convenient to use like this as it frees up my hands for typing on the computer and writing in the log book, etc.... However I have a D-104 mike with a Heil HC-5 element in it that gets rave reports from people without even asking for an audio check.

And joined the group here.One accessory that I'd like to get some recommendations on is a desk mike.The obvious selections run from the MC50,60,60A, 85,and 90.Is one of these better suited to this radio? Anything else out there that plays nicely with this rig?

Web page says they started shipping the roofing filter for the TS-850S
on 4/7/2009. Also says no roofing filter will be produced for TS-450/690.

Aloha ALl,

Got the TS-850 Roofing filter mod kit today(Super Service from Inrad)
Via USPS Priority Mail. Opened up the 850 and did the install via the directions supplied. Turned on the radio and the receiever was way down. WTF did I do wrong? everything was hooked up as per the instructions. Ok then I check for any shorts None found then I checked the voltage 7.8V at L92 not 12 hummmm. Took 12 volts off the acc power on the rear panel. Still no go HuMMMMM. after hooking up a signal gen. only S4 with 50mv signal, not good. Checked everything again all was as per instructions. I thought I had killed my babys ears. Then I swtiched the jumper coax's for the mod. Bingo it works like it should. and I can get 2.5khz from a S9+ signal and not even a stratch one. WOW I like this. So when you get the mod kit and find that your RX Sucks swtich the small coax's going to the mod board. I will call Inrad in the morning and tell then the hook-up on the jumpers are backward from the instructions. Now if someone would come up with a IF DSP Mod Look out K3. Is it worth the price? I will let everyone know after the next contest.

73 & Aloha
Roland AH6RR

7814. Inrad Roofing filter Mod

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-04-17 17:58:01 UTC
From: Roland Spoon
Topic: 7814 Message: 7814

As in a earlier post I did the Roofing filter mod to the TS-850. After looking at Inrads On-line instructions they have corrected the install jumper positions on the On-Line instructions. So if you order this Mod use the ON-Line instructions jumper placement not the printed one that come with the kit. I have uploaded 2 photos to the photo section one of them is the Inrad corrected jumper connections and one I did off the service manual board layout. So far I like the mod very much it has been great to hear a weak signal 3khz away from a S9+ signal with no interference.

Hello Steve,
I have found no changes except you can hear a weak station 3Khz away from a S9 signal with no interference from the stronger station before the mod I would have to get 15khz away before the scratching went away. I do some CW work but I have no CW filters, the filters I do have are the Inrad 1.8 SSB in the 8.83 IF and the 2.1 SSB in the 455 IF. I was going to try some CW today but the Bands are lousy today. And if anyone has a Inrad 2.1 for the 8.83 IF who wants to trade for a 1.8 please contact me mine is about 1 year old.

Most likely VCO-2. Do you have a service manual? If not try and scounge one up and check back.

7822. No TX on ts-850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-04-19 21:29:12 UTC
From: va3aso
Topic: 7822 Message: 7822

Hello,
I think I might have messed my rig. Last week, my receive dropped quite a bit, so I did some research and found there was a common issue with a diode that controls the tx-rx switching with can reduce the rx almost 20db. I changed the diode to an alternate one I had, and although it didn't help the receive, it still performed as normal. Then something happened. I may have shorted something while I was moving the unit around. Now I have little/no output on transmit. I know the mic preamp works as I can hear myself on another receiver but no wattage. Also, the auto tune light is constantly on and doesn't function. It only comes off if I disconnect it inside the radio. With the auto tune light on, I can't even key it up. Any idea where I should start looking for a problem? Thanks in advance...
Ron

Thanks Clif, but I found the problem. CAR unit has a 8.375MHz crystal that was showing 45MHz on frequency meter. Never could adjust variable cap down that far so I sprayed crystal with Freez-It & radio came alive. Funny thing is rig has been on 4 hours & still working fine, but I went a head & ordered one from East Coast Transistor.

Sure am glad it is something I can replace! If it had been one of those ICs or other surface mount devices it would have to go to someone with much better eyes & steader hand!

Thanks again!

First what diode did you replace with a sub? If it's the one I think then it's in the TX path and probably opened up when you keyed it up. Therefore no tx power out. I don't know about the tuner, try a reset...

Last week, my receive dropped quite a bit, so I did some research and found there was a common issue with a diode that controls the tx-rx switching with can reduce the rx almost 20db. I changed the diode to an alternate one I had, and although it didn't help the receive, it still performed as normal. Then something happened. I may have shorted something while I was moving the unit around. Now I have little/no output on transmit. I know the mic preamp works as I can hear myself on another receiver but no wattage. Also, the auto tune light is constantly on and doesn't function. It only comes off if I disconnect it inside the radio. With the auto tune light on, I can't even key it up. Any idea where I should start looking for a problem? Thanks in advance...

7825. Parts source for a MC54581P (relay driver for xmit filter board)?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-04-20 02:49:24 UTC
From: Rob Frohne
Topic: 7825 Message: 7825

Hi,

I was using the output of the relay driver (a M54581P) to select my antenna, and shorted it out accidentally. So I'm looking for a new M54581P. I guess if I can't find one somewhere, I will lift the leg and build my own transistor driver (only one of the eight drivers burned up). Anyone have any suggestions as to where to look. Google didn't provide me much on this other than a data sheet which is helpful, but not quite all I was really hoping for.

73,

Rob, KL7NA

Hey Cliff,
It was D31 on the rf board. I replaced it with a 1N4148, kenwood service says to replace with a MI204. I will get that one today hopefully. But I can't figure this auto tune thing. I have done a reset and still no help. I bypassed the tuner completely and still no wattage out and no meter readings.... Anything else I can check?
Thanks,
Ron

The 4148 can't handle the power going thru it and has opened up. The tuner WILL not work with no power out. Disconnect it and solve the power out issue and then start on the tuner.

Let's see. You are going to replace a battery that needs replacement about every 15-20 years with 2 that need yearly replacement plus are prone to leak. Huh??? The stock type batteries are available as well as the holders if you feel the need for it, both via mail order.

I ran into the same problem of not finding a CR-2032 holder so I put 2 AAs in a covered battery case and have no regrets. I figure alkaline batteries are probably good for at least two years and if by chance they should leak, they will leak inside the battery case so I am not very concerned. There is certainly less chance of damage to the radio now than with Kenwood's original design.

A differing point of view ;-).

Digi-Key has several holders. Just go to http://www.digikey.com and enter "cr2032 holder" in the search window. They are in the $1 to $2 range for one holder. I will probably get a couple on my next order from them.

7836. Inrad filter

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-04-21 15:37:06 UTC
From: Zack Widup
Topic: 6440 Message: 7836

I have an Inrad # 103 filter that's been gathering dust for a while which I intended to put in the TS-850. The filter has a connector for five pins at one end and three on the other end. My TS-850 has five pins on the board on each end and the YK-88-C-1 has 5-pin connectors at each end.

I'm always hesitant to go cutting off pins in a circuit but it looks like I'd have to do that to make this filter work. Is there another way around this, and if not, which pins do I cut off? Will it be possible to use the Kenwood YK-88C-1 filter again?

Jack the 2 pins you cut off are not used they are just redundant grounds. So the kenwood filter will work also with the missing pins.
so feel free to snip away. By the way the Inrad's are a much better filter. After using Inrad filters I will not go back to Kenwood filters.

Harold,

Most computer motherboards use a CR2032 battery for CMOS backup. You can likely obtain find both a battery and a holder at a nearby computer store or repair shop. They'll probably let you take the holder and battery from a junked motherboard. FAR Circuits sells a small PC board with an attached holder.

Fred,

Took me 6 months to find one. It happened to be on e-bay with a buy it now feature.

Steep price but I just saw one go on the bay between 300-400.00.

You just have to keep looking.

73,

John

Yes, the prices on them are crazy - two recently sold on ebay - the
first was what would normally be called a 'tech special'; untested,
missing parts and all cables. It sold for $385.00. The second was listed
as "perfect condition"; looked to be complete with all cables and manual
- it sold for $705.00...

Fred,
I have a DSP-100 that I use with my TS850. I am considering selling the DSP-100 and one of my TS850's, but will probably use ebay when I have the time to list it.

Hi all TS-850 users,
after modification of the two resistors the ALC problem still resisted,
so I finally decided to use a ICL7660S or LTC1144 to produce the -6Volt of the DCDC board
for proper stable HF-output.
see: http://homepage2.nifty.com/yamada_radio_clinic/archive/850_dc_dc/850dcdc.htm

It works perfectly.

you are right! I was thinking too simple, sri.
In this case it seems easier to change the two resistors on the DCDC board.

Use a 7660, it takes +12v in and creates -12v, then regulate down to -6 with a LM337.

Subject: [TS-850_450_690] Re: ALC issues

It will not work. A -6V voltage regulator will not produce

-6vdc from a +13vdc source. If you feed it a -13vdc it will

provide you a -6vdc output. The DC to DC board is taking the

+13vdc input and switching it into an AC voltage then rectifying

it and regulating a -6vdc output. I wish it was as easy as

replacing the stock part with a 3 terminal IC VRegulator.

The ALC voltage would seem to oscillate over a period of a minute or two from max meter to normal. If I applied full power the power output would fall to minimum as the ALC voltage climbed up to maximum and then would return to normal of about 100 watts in a few seconds. I determined that the problem was the on the DC-DC board as described by ON7GO on N6TR's website. I changed R2 and R3 from 22k to 18k as suggested and the ALC is now stable. However,

the RF output was very low. SO... I adjusted VR7 on the RF unit as per the service manual, item 25 on page 103. This adjustment was on 14.2 Mhz and I was able to get the RF up to 100 watts out with the ALC reading normal. BUT . . . . on 3.800 MHz the RF out is low and not near the 100 watts obtained on the other band. More like 30 watts. with the ALC

Very nice. The only comment is the ICL7660S has an absolute input voltage of 13v which makes the LTC part more suitable.

YAHOO.Shortcuts.sensitivityType = [];
YAHOO.Shortcuts.doUlt = false;
YAHOO.Shortcuts.location = "us";
YAHOO.Shortcuts.document_id = 0;
YAHOO.Shortcuts.document_type = "";
YAHOO.Shortcuts.document_title = "SP-31 Manual";
YAHOO.Shortcuts.document_publish_date = "";
YAHOO.Shortcuts.document_author = "ppagel@...";
YAHOO.Shortcuts.document_url = "";
YAHOO.Shortcuts.document_tags = "";
YAHOO.Shortcuts.document_language = "english";
YAHOO.Shortcuts.annotationSet = {

};
YAHOO.Shortcuts.headerID = "13bbb1acdda946bd12826f5c3872f05c";
```

Does anyone have a decent copy of a PS-31 Manual, or a pointer to one? I've located two such files, but they're poor photocopies.

73,

Paul / N1FB

Dave,

No, I didn't -- but you're right, there is some SP-31 information in the Service Manual: the schematic and PC-board layouts.

The manual I was referring to evidently is supplied with the SP-31. It consists of two pages identifying the control buttons and showing drawings of the front and rear panels; the schematic is included, but not the PC-board patterns/overlays.

I downloaded that file so long ago that I don't recall where it came from. I think it might have come from ModsDK.com. Unfortunately, it's not a crisp scan and I was hoping to find something better.

Hi Dave,

Thanks, those are the pages from the Service Manual. I'll attach my copies of those pages which I hauled into an old version of Paint Shop Pro and worked on. The other graphic shows the cover page of the SP-31 manual itself, which could use some help, but the original is so bad that even PSP can't help it.

I don't know if the Yahoo Group mail deamon lops off the attachments or not, but you should get a copy of this e-mail with the attachments intact as it is addressed to you.

Hi

This is VU2YK.

Last week I used my TS-450S and it was in perfect working condition. Amazing receiver and get unsolicited comments about nice TX audio with stock mic. The lightning fast relayless Rx/Tx switching is noiseless and any CW Ops delight. Full 100 watts out on all HF bands.

Yesterday I switched on the rig, and shock and awe ! Output power reduced to 40 watts ! All else remains same. Low SWR, Power supply rock steady. ALC indicator does not move, indicating some problem inside. I did not touch the rig in the last few days.

Will appreciate any help in diagnosing and rectifying the problem. Thanks !

73

Tighten the power cable connections on the power supply, change the fuses and make sure the power plug on the back of the radio is tight.

Howdy all!

I am sure this has been asked, and answered before, but I cannot seem to find the answer so here goes. I just picked up a fairly nice 850 to replace my possibly terminal 870 and I noticed that I have to turn the volume up more than I am used to with my 870 to get the same listening level. Receive signal levels are about the same, just the volume has to be turned up a bit more on the 850. I have read that there are issues with bad solder connections and wondered if I need to look into that as an issue. Just looking for a little advice. The radio's s/n is 21200901. Thanks! Dan KC5PCB

You can't compare an apple to an orange. I can think of a number of reasons for that and none of them are a problem, just a different radio.

If it has plenty of volume when all the way up don't worry about it.

Hi Clif!

Thanks for the reply! It just seemed a lot different when I compared it to my TS-870 or my R-2000. When the volume control gets to a certain point, beyond that it just didn't seem to make much difference.

Hi Dave!

Yes, I have checked "all of the above", but I do appreciate your comments because you just never know. It is just odd that a 1/4 volume setting was comfortable on my 870 and the 850 needs to be almost 1/2 volume to be comfortable. But as Clif stated, I can't compare apples to oranges. I just thought it was odd and something that might have been related to the bad solder joints associated with the 850.

An external speaker will level the playing field a litle bit. Try one on all 3 and see what happens. Or headphones for that matter, just anything but comparing the internal speaker.

> > I am sure this has been asked, and answered before, but I cannot seem to find the answer so here goes. I just picked up a fairly nice 850 to replace my possibly terminal 870 and I noticed that I have to turn the volume up more than I am used to with my 870 to get the same listening level. Receive signal levels are about the same, just the volume has to be turned up a bit more on the 850. I have read that there are issues with bad solder connections and wondered if I need to look into that as an issue. Just looking for a little advice. The radio's s/n is 21200901. Thanks! Dan KC5PCB

Hi Clif!

I have the SP-31 on this 850 and I have compared it to the internal speaker. They seem to sound the same, but I will do some more testing just to make sure I am not chasing my tail.

An external speaker will level the playing field a litle bit. Try one on all 3 and see what happens. Or headphones for that matter, just anything but comparing the internal speaker.

Hi Cliff

Thanks. As you can I see I did all of that. How can you explain the fact that ALC does not move . Indicating reduced drive maybe ?

Ham Radio 101:

ALC, Automatic Level Control, A circuit designed to limit power out to a preset maximum.

ALC Meter, Presence of ALC indicates the unit has reached the preset max power. As the ALC indication increases the unit is reducing gain to maintain no more than the preset power. The higher the ALC reading the more the gain is reduced.

In this case with the power out set to max, 100w, the ALC will not operate until the radio exceeds 100w of output power, then the higher the Car is set the higher the ALC reads to maintain the 100w setting.

7868. TS-450 being donated and needs checkup - need advice

Yahoo group: TS-850_450_690 (2006 — 2009)

Kenwood TS-850_450_690Hi all,

I'm helping to facilitate the creation of a Amateur Radio station in a local adult living and assisted care facility. The HF radio will be a TS-450S, currently owned, but not used recently, by the resident of the facility that has been pushing to create such a station/opportunity for the residents.

We are pretty much done with the planning and approval, and now are going to build things out (which pretty much means install the antennas and then mount the equipment in a secure area.) I wanted to make sure the radio works properly prior to installation. The owner thinks he might have the service manual (and if he does not, I imagine that I can d/l it off the 'net') and has no idea what filters are in the radio (give him a break, he's 92 and at least he remembers his call and what he had for breakfast.) It has not been used reciently and the exact condition is unknown.

Our local club, will be "trustee" for the equipment but isn't in a position to spend any money on it right now, but I suspect the facility might be, and we have the time right now so I want to deal with any problems prior to installation. What issues does the TS-450 have. I read this list regularly (I have receiently acquired a TS-850SAT - that needs filters) but haven't seen too much in the way of regular problems on the 450. Someone is planning on doing the regualr basic stuff: check output power, 2-tone, on the air checks, but what else should get special attention. I really want this radio to be a resource for the residents who are hams (there are at least three.) With that in mind, I want to make sure that it arrives in a working condition and not sit there needing repairs or upgrades to be usable.

Thanks for any advice and guidance.

73,
Grant

Unless you have some contesters or avid CW buffs just run it as is. No need for filters. If someone feels they are an absolute necessity they are plug-in filters thru the trap door on the bottom, 10 minute job with a coffee break in the middle.

Hello all,

I bought a TS-450SAT from a dealer after upgrading three years ago, but never transmitted on it because I didn't have an HF antenna at home (that's another story). The receiver worked OK with a random wire antenna.

Today I brought it to a buddy's house to try it out on his OCF dipole. I turned the transmit "on" in Menu 19, and can hear the tuner working and see the tuner light. However, the radio doesn't appear to be transmitting and the light doesn't come on.

Rechecking the user manual, I was surprised to find to find it had fewer tips in it than I thought.

Any tips would be appreciated, thanks.

Mike, n2mho in SNJ

what mode are you checking transmit on....

whatare you using to key the rig with, send button, hand mike, cw key ????

does the ptt light come on, but no output (needs audio)

IF i had bought a radio for hf prices, i would have at least tried it on a dummy load, but oh well. good luck

Hi Mike,

Make sure the carrier is turned up. There is no output without any
carrier injected for tuning.

It's Japanese logic. Off means on and on means off.

Menu 19 is Transmit inhibit. They just didn't explain it.

ON = TX Inhibit
OFF = Normal TX.

Ron and Dave,

This could turn out to be simple, although simple-minded on my part.

Following my understanding of the manual, I set MENU 19 to "on" before
my problems as described before.
I didn't think to change it back to "off" until I got home and tried
it with a dummyload.
-- This seems to work, and I am going to try some air tests tomorrow.

Thanks for your comments and suggestions.

From: N2MHO
Topic: 7874 Message: 7879

In the TS480 manual, the equivalent item is clearly labelled as
"transmit inhibit."

Thanks to all....

Hi

My DSP-100 don't RX.

I think something went wrong.

Any help?

Many Thanks!

7881. Re: PA7TWO KWD-TS850Sat terrible smell after short transmit

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-05-04 21:08:30 UTC
From: f5rds
Topic: 7082 Message: 7881

Dear all,

First mail on this forum so first hello to everyone !

I just experienced the same issue as described below (smell, no TX, no red LED when keying, although the smell came but without more issue, then no TX appeared curriously several months after the smell !) so my great thanks to the contributors of this post which helped me to find quite rapidely the causes !

First, I checked C1 on CAR unit which was dead so I replaced it and checked the board under it. This did not solved the issue.
Then, I checked on IF unit the small board TRX X59-3680-01: Q152 seems to have exploded ! When trying to transmit, pin 2 goes to 3.2V (normal), but pin 5 stays at 0V and pin 10 stays at 8V so clearly the TRX board needs repair.
Before ordering a new one, I would like to be sure I can unsolder properly the dead board. I found a note from K0BX explaining that for the board DC-DC X59-1100-00, it should not be unsoldered but the pins must be cut, and then unsoldered on by one after being cut.
I was wondering if this is the best approach for the TRX board because pins 1 to 4 seems hard to access ? I would be happy to get feedback from those who have removed this board adn how they have done it.
Just for information, I have a good temp controled ESD safe soldering iron but do not have an unsoldering station, just plan to use solder wick and a solder sucker.
Many thanks in advance for your possible help.

Best 73,
Olivier, F5RDS

7882. TS850 output power drop vs band

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-05-05 14:21:59 UTC
From: Patrick Egloff
Topic: 7882 Message: 7882

Hi All,

I have been asked for a problem on a TS850.
The power drops when going up in frequency 3.5MHz (100W) 14MHz (60W) and 28 MHz (30W).

I suggested to look for a stable ALC voltage.

Any other suggestion to cure this problem ?

73,
Patrick

7884. TS-850 RTTY behavior ("Down surge" when intial xmit)

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-05-09 20:30:54 UTC
From: Bruce Sawtelle
Topic: 7884 Message: 7884

Recently, I've been seeing my TS0850 "down surge" when I first start to transmit. In th past, it usually kicks up to the 30-40 W level once it's keyed. I'm using MixW and a S/B USB sound card that all works well in other modes from what I can tell. At first I thought it might be high SWR, but I re-verifed ~1.3:1 in the 20M RTY band. I'm seeing similar behavior on the other bands as well, though. If I keep the PWR control at ~1 o'clock and mic gain at 9 o'clock, it seems to run fine. However, if I move the PWR control to 2-3 o'clock, I get this behavior. Thought I might be getting some RF back into the USB soundcard, but haven't determined that.

Anyone seen this behavior before? Almost seems like a cap in the audio path needing to be charged on the initial PTT closure.

tnx es 73

I forgot to mention that if I immediately re-transmit (i.e .within 1-2 seconds), it comes up to the normal levels, thus the reason I think it's some capacitive-charging type action. f I wait 3-4 seconds, I get the same "down surge" then recovery for the balance of the transmission. Also, I just confirmed the same action when I run MFSK16, so it's not RTTY specific.

Put it in CW mode and key it down at 100w. If the power out goes up and down search for DC/DC converter in this group, tells all about it.

7888. TS850 receive start up problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-05-10 08:48:15 UTC
From: Tracey Gardner
Topic: 7888 Message: 7888

I have acquired a TS850 which has been in storage for some three years since its previous owner passed away.
On powering it up, I just get a load of wideband noise for the first 90 seconds or so and then it sounds as though the tuning is being turned very rapidly with stations whizzing through the passband.
It sounds very much to me as though the synthesiser is not locking?
After about 90 seconds, signals are received but tuning the receiver too quickly seems to "unlock" the synthesiser again and it takes a full 5 minutes before it settles down completely and works as expected.

I know that this fault existed when its previous owner had it but he didn't get round to having it fixed due to his circumstances at that time.

Before I start delving into the rig, is this fault a common one and if so what is causing it etc.

I haven't fired it up yet on transmit as I thought that I had better get the receiver working as it should do, first.

Many thanks

Tracey G5VU

7889. TS-850 RTTY behavior ("Down surge" when intiial xmit)

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-05-10 15:16:20 UTC
From: W3NJ@aol.com
Topic: 7889 Message: 7889

Thanks Dave and Clif for the info.

I may have the answer after some testing this morning.

?I noticed yesterday it's was a bit windy. Even though I didn't see a change in SWR yesterday (with antenna tuner disabled naturally), I did notice with key down CW it would "wiggle" at a slow rate of about a 1 Hz over one meter "segment" (i.e. 100W to 90W). Somewhat in time with the coax going to the antenna.

When I tested this morning with virtually no wind, I don't see the" wiggle" and the initial RTTY amplitude is right at 40W as expected, no downsurge

So I'm going to keep your suggestions in mind and when I open up the 850 again, check out the caps and DC-DC converter. But for the short term, looks like I need to do some maintenance on mymultiband dipole (I'm thinking the balun may have some issues, as we experienced some 2-3" hail that beat the daylights out of my roof? and trees....suspect the balun may be damaged.)

tnx agn es 73

Date: Sat May 9, 2009 3:38 pm ((PDT))

Put it in CW mode and key it down at 100w. If the power out goes up and down search for DC/DC converter in this group, tells all about it.

Clif

7890. Then again (DC- DC) .....Re: TS-850 RTTY behavior ("Down surge" on intiial xmit)

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-05-10 21:05:27 UTC
From: Bruce Sawtelle
Topic: 7889 Message: 7890

OK, I can tell Dave and Clif are definitely seasoned on the TS-850. After reading their messages more, I tried another test but letting the TS-850 cool down for an hour. Despite the wind picking up this afternoon and the antenna/coax swaying, I had a solid signal (CW and RTTY) for the first 30 minutes or so. After 30 minutes, I started to see the "pulsing" associated with the DC-DC converter board failure I've read about in the Files section as well.

Considering the unit is over 20 years old, can't complain about replacing a ~$10 board. While I'm at it, I'm going to check on caps, batteries, gas discharge tube, and see if I can do the noise blanker mod. Already have the all band xmit for MARS operations.

Guess I'll need to dig out my old Atlas while I have the Kenwood on the bench :-)

tnx agn Dave and Clif for your insights.

Bruce, you'll find this group is well informed. The mods are worthwhile, especially those involving moving the location of the CMOS memory backup battery and adding the ability to use a second CW key alongside the internal one. I've also done the MONI mode for CW, the noise-blanker mod, transverter interconnection, separate receive antenna and others I can't recall now. Take care when working on the rig and all should come out well. If you don't feel comfortable doing the mods yourself, err on the side of caution.

I recommend you use a digital camera and take lots of pictures of the various sections of your rig before and after the mods.

We're especially blessed to have Clif Hollander's input on so much of the Kenwood material.

73,

Paul / N1FB

7893. Part source for X59-3680-01 sub-unit TRX in Europe ???

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-05-12 20:07:48 UTC
From: f5rds
Topic: 7893 Message: 7893

Hello,

This TRX sub-unit has failed on my TS-850s (Q152 has exploded following a C1 failure on CAR unit). I have found this small board available on www.partstore.com and on www.pacparts.com. However, none of these sites seems to accept to ship outside of US.
Does anyone know how to get this from France ?
Many thanks for your possible help.

Regards,
Olivier, F5RDS

I have used East Coast Transistor many many times and they ship to the
EU, they do show the part in stock:.

Oliver,
East Coast Transistor ship to Europe with no probs i have used them many times for parts and they ship very quick. click on link for more info...
cheers......John

Hello,

This TRX sub-unit has failed on my TS-850s (Q152 has exploded following a C1 failure on CAR unit). I have found this small board available on www.partstore. com and on www.pacparts. com. However, none of these sites seems to accept to ship outside of US.
Does anyone know how to get this from France ?
Many thanks for your possible help.

Regards,
Olivier, F5RDS

Can someone identify the wrench type and size used on the TS-850 main tuning knob?

I've tried about 20 Allen and Bristo wrenches and they're all apparently either too small, too large or the wrong type; I don't want to force anything. From what I can determine, the Service Manual doesn't identify the setscrew used.

Tnx es 73,

Paul / N1FB

Hello,

I would like to buy 4 or 8 YM 66312 IC-s. There are only some pixels on the display of my TS850 from x.323 KHz to x.499 na x.823 to x.999 KHz and UL in morse , PLL is not locking. It is working from x.500 to x.823, but there is no good received signal. Transmitter is working everywhere. Signal on test point TP1 carrier board 1.75V.

Pista, sorry to say, you are going to find those ICs very difficult to locate. Kenwood no longer has any stock, the manufacturer who made them for Kenwood is no longer making those ICs, and no Kenwood parts suppliers of which I am aware has them in stock or is able to get them.

If you find such ICs offered for sale, you had better ensure they are *really* those ICs and not bogus ones that are other types and have had their identity changed.

In the recent past, there has been a flood of messages concerning those ICs (check the Yahoo group archives) and no one, to my knowledge, has found a legitimate source for the real YM6631 (early version) or YM66312 (later version) ICs.

I wish you good luck! You may need to purchase a CAR Unit from someone who is parting out a TS-850.

73,

Paul / N1FB

I have two of them (with BS-8s).

They work 830, 850. 940, 950, and perhaps others - plus they are great for trapezoid tuning with linear amplifiers.

Hello to all.

I just purchased a real nice 450sAT. The serial # is 610000131 so it was made in late 1994. Question is how hard of a job is it to remove the litium battery and run wires to relocate the battery with a battery holder and where would i get the holder and battery? Maybe i should just drive it up to kenwood 4 miles from my QTH. What would they charge to do this. I hate to leave it in there and have it damage the radio.Thanks to all.

1: why change the battery, is the memory dead.
2: battery holders and sometimes batteries are free if you take the (unsolder) from most computers
3: cost at kenwood??? ask them.. they may only replace original, not move it

most electronic places have the battery holder and a cr2032 battery

good luck

A grand, $1200?????????? Depends on whether the battery has leaked all
over the circuit board or not. If that is the case, less.

Based on my ALC "pumping" when I transmit, I've ordered a replacement DC-DC converter. Wanted to let folks know that the ship date is June 24th, so they must have a big demand or they are building them in batches with nothing in stock.

As some background, has anyone debugged the board to confirm what the failed component is? I've seen some mention of the caps and a rumor that some had them in backwards. With the little circuitry on the board, I assume it must be a single component failure. Once I get mine replaced, I think I'll do a bit of probing on the old one to see what's what.

tnx es 73

Bruce,

Check out :
http://n6tr.jzap.com/850repair.html#ALC_voltage_problem

ON7GO describes the problem and an easy fix to the tee. I replaced R2 and R3 with 18K 1/4 watt ones right on the board and my ALC returned to normal operation. Fix took about 15 minutes.

Tom

7911. TS-850 Receiver dies

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-05-24 00:20:57 UTC
From: kremper4-850@yahoo.com
Topic: 7911 Message: 7911

I wonder if anyone has experienced a TS-850 receiver problem such as the one I'm trying to troubleshoot. A friend's TS-850 developed this problem during Field Day 2008.

The problem manifests itself in different, albeit similar, ways. Intermittently, the receiver will fail to return after transmit. In each instance, there is just dead silence. Tapping the key to produce a dot or dash, or pressing the mike PTT button, will generally bring the receiver back to life. The audio section is functioning during the receiver failure.

Many times, just turning on the transceiver results in no receiver activity. Again, tapping the key or pressing the mike's PTT switch will wake the receiver.

In SSB mode, I've noticed that the receiver will suddenly die; I've not experienced this happening in CW mode.

I noticed, too, that without a ground connection to the transceiver, merely disconnecting and reconnecting the antenna PL-259 to the SO-239 socket (be it a dummy load or other antenna) results in killing the receiver.

I've tried bypassing the T-R relay and internal antenna tuner without benefit. The CAR Unit board caps are OK.

The TXB and RXB voltages on the RF board appear to be right on.

I'd appreciate any input that can steer me in the proper direction.

73,

Paul / N1FB

This is a long shot since all your symptoms do not exactly fit mine, but I had a problem with the audio completely disappearing, often when the 850 was first turned on. Sometimes rotating the volume control back and forth helped - other times it didn't. In any case, I found my problem to be that the contacts on the external speaker jack located on the rear apron that routes the audio to the internal speaker, when there is no external speaker, were intermittent. I had a hard time figuring it out because I normally never used the rig with an external speaker. You might try plugging in an external speaker of some sort and see if the problem disappears. As I said a long shot, but it shouldn't take much effort to rule it out for sure.

Thanks for your suggestion. I had experienced the external-speaker jack and dirty volume control problems on another rig, so thse are two more of the items I tried with the current one, but they didn't pan out.

I suspected the squelch control and hear a "thump" as it's rotated, so I'm eliminating that, too.

Thanks Tom,

Great link, very informative. I calculated the multivibrator freq tobe ~ 15KHz, so will confirm that as well. I see a note about the caps on the board may also be suspect, so I'll get a few of those just in case.

tnx agn es 73

Check the connection from the SO-239 to the circuit board. I had the same exact symptoms 2 years ago on my TS-450S and it turned to be a cold solder joint.

7918. ACC 4

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-05-25 15:32:19 UTC
From: David
Topic: 7918 Message: 7918

I would like to power an external digital device from my TS-850. I suspect that the ACC4 may have 12v, but I can not find it in the Instruction Manual schematics. Does ACC4 have 12v DC on any of it's pins?

Check the connection from the SO-239 to the circuit board. I had the same exact symptoms 2 years ago on my TS-450S and it turned to be a cold solder joint.

7921. TS-850 ACC 4 Socket Info

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-05-25 18:00:20 UTC
From: kremper4-850@yahoo.com
Topic: 7921 Message: 7921

Probing the ACC 4 socket with my voltmeter shows that the bottom-right socket hole provides 13.8 V dc. Because the AT-300 manual states that that tuner requires a maximum of 2 A, it seems logical to assume that ACC 4 will supply that amount of current.

This document I found likely provides the information you need

http://www.ham-kits.com/KWTuner/KWT%20technical%20description.pdf

better than the AT-300 manual I referred you to earlier.

Topic: 7923 Message: 7923

How important is it to replace the Lithum battery on a TS-850S if I do not intent to use any memory functions. I was thinking of removing it and not replacing it. Can I get some comments if this is not a good idea. The battery is fine and is still working, but it is the original battery on a rig that was originally bought in 1996. I just wanted to remove it before a battery leak happens.

Thanks for the feedback -- Norm K9NK

I replaced mine last year and it was still good. Someone somewhere had one leak and ruin the PCB so I decided to pull mine.

It was a major disassembly to get to it and so I jumpered some wires to a R.S. battery holder so I can get to it easily next time. Also I have a DRU-2 and replaced that battery as well. The battery there I might add never worked, the memory did if I left the radio on.

There are some helpful hint in this groups Yahoo site.

its a good idea to re-locate the battery if you are going to hang on to the radio for a long time,prevention is better than cure as they say, ive already done the job for a friend and didnt find it difficult,ive posted photos in the photo section of the job i done and the radio was an 850s....jm

7928. TS850 low SSB power

From: rovntoma
Topic: 7928 Message: 7928

Hallo,my 850SAT on 10m band(I have only 10m antenna) get in SSB mode 50-70w only.In CW and FM is going over 100w.I tried set VR6,7(alc) with no luck.Start TX with strong voice is 100w OK(ALC meter is going ower zone)but then with normal voice output is peaking to 70w.I am using mc60 without preamp and increased mic gain is not increase power,only audio level.How is possible set output power properly to 100w?
My 850SAT is S/N 3040XXXX and SWR is 1:1,5
(My secondary 450SAT give little over 100w with the same antenna,PS and mic.I remeber,that I must set VR15 to 100w power a few years ago)

Buy a true peak reading meter.

100w in CW on an average reading meter will show 100w, it's a constant level. In SSB it will usually only show 30-50w because the voice level is not constant therefore the power level is constantly changing but the averaging meter cannot respond that fast so only show the AVG power. If the ALC is moving then the radio is putting out 100w on peaks. The ALC indicates how much the radio has to turn down to not exceed 100w. The harder you shout the higher it reads because it's turning down to not exceed 100w.

Sure, buy an amp or a TS480HX. When the power is turned up past design level they tend to get dirty, not making you very popular on the bands. Unless of course, you are a US Childrens Bander and they won't notice...

Tony,I would take the top cover off & look to see if it is leaking. If not measure the voltage & if around 3 volts I would put the cover back on.

My in-laws was bought in December of 94 & I just took the cover off theirs for the first time to fix the PLL circuit & battery was in good condition and had 3.4 volts.

Mine was bought in Sept. of 95 & when I checked it a few years ago it had just started to leak. It still had over 3 volts. I cut the old one out leaving enough metal to solder a battery holder. I ran wires to holder & believe I placed it in the opening near antenna tuner. Taped it up real good to keep it from shorting to the tuner or case.

I got holder & battery at Radio Shack. I believe I used CR2032 battery. Funny my TS-50s battery only lasted around 5 years. I had to use the solder type battery with it. Kenwood charged me a nice price for the solder type. I couldn't find one here locally.

You'll enjoy the 450! They are great rigs! I use a Heil mike element (non dx element) with mine & get great audio reports.

Thanks Clif
I compare 450S and 850S face to face.The 450 getting peak SSB 100w with measured 20A peaking current,the 850 peaking 70w with 15A current drain.It is a comparable radios,contains the same finals and comparable circuits.I think problem will be in ALC circuit or any caps leaks,when VR7 not helped.I will try VR1 in filter unit for ALC frequency charakteristic accordind service manual.
Any peoples getting over 100w (120-130)from this radios,but it is not good for the finals life and "clean" output.I looking for standart factory SSB adjustments with 100w peaking with normal speaking voice when 20A peaking current is draining.

In SSB it will usually only show 30-50w because the voice level is not constant therefore the power level is constantly changing but the averaging meter cannot respond that fast so only show the AVG power. If the ALC is moving then the radio is putting out 100w on peaks. The ALC indicates how much the radio has to turn down to not exceed 100w. The harder you shout the higher it reads because it's turning down to not exceed 100w.

With my pot VR7 is no possible settings power.It means setting this pot has absolutely no effect change power.(Maybe DC-DC board?)

What is the power output of each rig in CW mode into a dummy load?

The controls you are messing with have nothing to do with power out, one is the ALC meter adjustment and the other is a power limiting pot.

Many thanks Clif
it is true,that not will be a common power problem.Previous owner (silent key)used it with linear amplifier.Maybe something set a little down.There is no posibility get output power in SSB mode over 75w.Increased mic gain only distorted audio,no increase SSB power.ALC is little agresive I think.The same I can get from my ts450.When I set output power knob to 75%.(No full)Then ALC is little over zone and power is 70w.

you can always inject a steady tone into the mic to check the output in SSB.

to Clif:I don have dummy load.When PWR knob is full and CAR knob is about half position (12 o clock)I get full CW output(100w).
Inject steady tone 1khz to microphone get constantly 100w SSB with good ALC,but speaking to MIC peaking 70w with ALC over zone.I think
that something with ALC settings is wrong.

if you get a constant 100w reading when injecting a tone, everything is fine....the meter wont read fast enough to keep up with the voice peaks...I cant remember how to do it, but there is a menu option to set the meter to a peak reading meter, you may try that and see if you dont get a peak reading at 100w out, but it sounds like the radio is fine. Ask someone how it sounds on the air, thats the key, if it sounds overdriven, it is....

It's working perfectly, leave it alone. Go study the difference between average power and peak power in regards to SSB transmission.

Thanks guys
It seems good,but...
Why injected tone (stronger than voice) has good ALC?
Normal speaking voice has bad ALC.(over zone)
I have a funkcion peak meter always turned on.
I dont want nothing more only this:
(look for this video in 3 minutes and 30 seconds)
http://www.youtube.com/watch?v=_pdhyjWZyNQ
Nice peaking to 100w ALC is stable and only little over zone.My radio peaking only max to half "red zone" between 50 and 100w.My ALC started over scale after turn PTT.Peaking ALC is very high and going quickly up and down.Its not stable.Tomorow I will try measure and set ALC voltage according manual.
Thanks for any idea.

Now I know this may be a wee bit of a strange question to you more experienced type chappies but here goes!
I've recently acquired a really nice TS-450 (only the second owner!) which compliments my 850 very nicely thank-you.
It didn't come with any filters apart from the stock, now I don't use cw I'm exclusively SSB phone so I'm looking for advice on the best SSB filter to add.
Would one of the optional Kenwood filters suit or would it be worth paying a bit more for an Inrad for instance?
Any thoughts!

Regards,
Martyn

Go with the Inrads they are much better than the Kenwood Filters.
By the way the Inrad Roofing filter in my 850 has made the radio 100% better on contest day on the bands.

Tom,

You need to really watch that You-Tube carefully. After the long comments from the DX station with nice, steady S9+20 S-meter readings, when the local begins to transmit, we see the power meter fluctuating just like you say yours does. You may have a bit too much gain in your audio channel, or your voice processing is turned up too high, but I agree with Clif -- it's working as designed, and exactly the way SSB should work, if you see variation in power output as you speak into the microphone.

Again, the You-tube video shows the fluctuations in power during the first transmission from the local.

I think you may have your voice processing set up with too much gain. The radio otherwise looks like it is working fine. What do other stations you work say? (barefoot, of course).

By the way, the "I want it like this" You-tube video with the ZL station looks like he uses a good amount of speach processing, but his audio level is much more consistent (in the recording) than yours. You have a lot more variation in your speech level than he did.

I suggest you follow the speech processor setup and power setup instructions in the Kenwood manual carefully before worrying about this. Again, the meter activity in your video seems fine for normal use. If you use more speech processing (compresses the high points, boost the low) you'll see less fluctuation, but somewhat unnatural sound quality at the other end.

Another idea is to invite a nearby ham to come run your rig while you go to his or her shack and listen to your rig. TS-850s sound very good when not overdriven.

My idea was use this radio as ESSB "HiFi" TX SSB sound quality.
I tried original mic,MC60 and Behringer MIC2200+DSP110 compressor with Nady microphone.In all cases was not possible going over 70w without overload ALC or audio quality.TX audio is not bad,but is little "dry" weak and flat.My ts450 has better audio.(more punchy and clear).The radio was not used more than two years.Still I replace caps in carier and display board.Maybe it need replace all elyts complette.

7955. ts-850 problem with uninstalled tuner & cw side tone - in plain text

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-05-30 17:07:48 UTC
From: barnabas0223
Topic: 7955 Message: 7955

De Jim, KI6UP in Panama City FL. Sorry the orig posting was in HTML I guess. I forgot to use plain text - sorry

Couple real quick questions ☐ please

I just got a ts-850 ☐ and have a few issue maybe you know the solutions to.

The guy I got it from removed the internal tuner before sending it. I set it up ☐ and all modes ☐ all bands, MAX SWR and no power out. All other functions seem to be fine ☐ except no side tone on CW. I mean ☐ none. \\

I read the manual and to install the auto tuner, page 70, instruction 3 says carefully remove the coax. It looks to me like the rig with no tuner comes with a coax jumper between the cable jacks that the internal auto-tuner cables go to??? If this is the case ☐ mine has no cable and, no tuner

A crazy switch in the back ☐ SW-1, for internal tuner ☐ set to int ☐ for ext tuner ☐ set to ext (at-300 kenwood etc) - what about for use with a real tuner ☐one that only connects to the rig with coax☐ is it int or ext on the sw-1????

I cant live with no side tone ☐ ideas there? I thought maybe because of the max swr (dead short), and no output equals no side tone. All other tones work, cw for mode changes, messages etc.. The monitor works fb with voice. Pitch is at 700. No voice unit. In menu, mine jumps from 19-to-21, so no control on tuner there? Keyer is on - and when sending cw - it sends fine on the tx - just no side tone - in the head phone or speaker.

Please Help

Jim - KI6UP

7956. Re: [TS-850_450_690] ts-850 problem with uninstalled tuner & cw side tone

Yahoo group: TS-850_450_690 (2006 — 2009)

From: Dave ve3wej
Topic: 7956 Message: 7956

side tone audio is volume controlled, maybe it is turned down..
if the previous was using a ext keyer, it may have had the tone on it

check pg 65 of the manual for level

Subject: [TS-850_450_690] ts-850 problem with uninstalled tuner & cw side tone

Couple real quick questions –
please

I just got a ts-850 – and have a
few issue maybe you guys know the solutions to.

The guy I got it from removed the
internal tuner before sending it. I set it up – and all modes – all bands, MAX
SWR and no power out. All other functions seem to be fine – except no side tone
on CW. I mean – none. \\

I read the manual and to install the
auto tuner, page 70, instruction 3 says carefully remove the coax. It looks to
me like the rig with no tuner comes with a coax jumper between the cable jacks
that the internal auto-tuner cables go to??? If this is the case – mine has no
cable and, no tuner…

A crazy switch in the back – SW-1,
for internal tuner – set to int – for ext tuner – set to ext (at-300 kenwood
etc) - what about for use with a real tuner –one that only connects to the rig
with coax– is it int or ext on the sw-1????

I cant live with no side tone –
ideas there? I thought maybe because of the max swr (dead short), and no output equals no
side tone. All other tones work, cw for mode changes, messages
etc.. The monitor works fb with voice. Pitch is at 700. No voice unit. In menu, mine jumps
from 19-to-21, so no control on tuner there? Keyer is on - and when sending cw - it sends
fine on the tx - just no side tone - in the head phone or speaker.

Please Help

So guys
solution is very simple.Big mistake on my side.I set VRs on IF no RF unit.Now radio decently peaking 100w as in video no1.Thanks for
help and sorry again.

A-a-a-a-r-r-r-r-g-g-g-g-h-h-h-h-h!

A suggestion: Use a digital camera to take pictures of *EVERY* board in your TS-850, save the photos to your PC's hard drive under each board's specific name, print the pictures and label them. Be certain to take close-up shots and use a high-resolution mode so that you can zoom in on the details of the area(s) under investigation. This is sure to help in the future.

Good afternoon,

Hows everyone today? Boy what a beautiful day here in Central MN. I just joined up here becasue I might becoming a proud owner of a TS-850. This one I am getting will cost 750. It will already have a 2.7 Khz filter in it.

My question is this how has the 850 performed for everyone? How are the ears on it? The S/N is 60100267.

73,

Ben KØBLR

Ben, this one of the best investments you've made in ham radio. This is a super radio and you have one of the last ones, so pretty much the bugs (early chip problems are gone) are gone.
Enjoy the radio and read the manual to learn how to take full advantage of the capabilites. It is worth it.

Ben,
as already stated, you will have one of the best radios ever made.

I have had a bunch of radio's in the shack,and most have come and gone...
but my 850 will never go.
right now,side by side with a K3 and a FT2000,
the TS850 more than holds her own on receive and transmit.
In, fact, even though the FT2000 has the heil 781 mic
and all the fancy equalizers, I still get the best
audio reports on the 850
with the heil gm-5 mic..
(and the 850 has one of the best processors ever!
beats the 200W FT2000 every time!!)
The 850 also more than holds her own in contests,
and now, with the Inrad roofing filter,
can only get better!!!
She's a keeper !! Take good care of that radio...
do the upkeep
(Caps..battery,ect,) to keep her running...
You will never let that radio leave the shack.
The TS-850, is the best kept secret in Ham radio.
Enjoy!

Ben,
First thing to do, you've already done !!
Join this group...!!
Now...
Spend some serious time reading thru the posts
and the file's section to familiarize yourself with the TS-850.
Then, decide whether you want to do any work and modifications yourself.
If not, send an email of to Clif,
(check out his website, http://www.avvid.com/)
"clif@....", and discuss what you would like done,
he's the best Kenwood repair tech out there.
Good luck.

Hi Ben,

You will be disappointed. The 850 has a great receiver and it has a lot of talk power. I run mine with an Ameritron AL-80b at about 800 watts into a vertical dipole. A pretty modest setup. If I use the High Boost button and the speech processor, I regularly bust through pileups when chasing DX. I have never had a rig with this kind of talk power. I have the INRAD filters installed. You can also now get the INRAD roofing filter mod for this rig as well. I have not installed it yet, but have heard from others that it works great. Another great feature in this old rig is that it has an IF port on the back. You can use with the LP-PAN and get a great spectrum display on your computer. Look me up on QRZ and I have a link there to my Youtube video showing the 850 with the LP-PAN. It does not get any better than that

Did you mean "You will NOT be disappointed"?
:-)

I think the TS-850 is the best transceiver around for its price on the used market. And it's still one of the best rigs, even compared to the more modern ones.

I used a TS-440 for years and finally decided to get a TS-850 back around 1998. It's been doing great.

Hi all, I own a TS450S, can anyone explain me how can I know the year of manufacturing of my rig.
It´s serial number is 309009**
Additionally, I want to know between what years was manufactured this rig.
Thanks in advance,
Claudio

Ben,
First thing to do, you've already done !!
Join this group...!!
Now...
Spend some serious time reading thru the posts
and the file's section to familiarize yourself with the TS-850.
Then, decide whether you want to do any work and modifications yourself.
If not, send an email of to Clif,
(check out his website, http://www.avvid.com/)
"clif@....", and discuss what you would like done,
he's the best Kenwood repair tech out there.
Good luck.

Ben;

The TS-850 is what I have and I love it. I have had great luck making Q's with it. I have had mine for only about 4 years. Bought it from Doug before he died. It was the best deal I ever made. You can't go wrong with a good TS-850.

it's a software defined panaromic display, lets you view a wide chunk
of spectrum for signals, etc, like a spectrum scope on some of the
newer radios....

It taps the IF port on the back of the 850 and gives you a nice
spectrum scope on your computer

it's a software defined panaromic display, lets you view a wide chunk
of spectrum for signals, etc, like a spectrum scope on some of the
newer radios....

Hi group,
Well 24hrs after leaving the group i decided to come back
because hope is not lost. I found some one else with an 850. Not sure
if it has filters or not but can filters still be had through Inrad.
Also what is IP Lan or something like that?
73,
Ben K0BLR

Hey all - I was thinking about replacing the CAR board with a new unit. I located a place that has or had them, but they wanted a board part number - or some way to ID the board so they could find a replacement - any ideas, or where can we get new boards?

thanks - Jim KI6UP

Topic: 782 Message: 7982

I am a new member, looking for advice on curing a noisy TS850S; unfortunately I shall be learning how best to use a scope and a sig gen at the same time, but having (fairly) recently retired, can at least spend several hours at a stretch at the bench.
The fact that narrowing the filters does very little if anything to increase the S/N ratio presumably means that re-alignment is in order, assuming I can locate a service manual; at the same time, some idea of where the noise is being generated would obviously give me a flying start: is there a consensus that this rig has a noisy synthesizer, or that a particular board/component is prone to failure?

Incidentally, I'm not expecting the purity of a Drake or Collins receiver, the yardstick is an FT840 (heresy?)which out-performs the Kenwood on both TX & RX, when surely it should be the other way around?

Any help would be very much appreciated.

Hi,

I'm in the same situation as you: new HAM, new member, newly got a TS-850 which I thought it's more noisy/less sensitive than my Grundig YB-400.

I did a simple check for common problem for low sensitivity and confirmed nothing wrong. I believe it need a alignment. I checked the service manual. It is likely that the basic requirement for most alignments is a multimeter and a network analyzer(or precision sweep generator + detector + scope). I don't have those equipment.

I don't know if somebody has an idea of doing alignment without those expensive equipment.

Thanks.

I only have one comment; "Fools rush in where wise men won't go"

If the radio's in question have not been "messed with" as you are wanting to do alignment will not probably (95% certain) not help.

As to being noisy, disconnect the antenna, does the noise go away? Then it's not inside the radio and alignment won't help.

As to sensitivity, you need a calibrated signal generator to evaluate the sensitivity of a radio. If in checking the radio is down in sensitivity by more than 1-2 db it's not alignment, it's component failure.

Alignment is the very last thing a tech will do after repairing a radio, not the FIRST.

Clif

Hello, the TS-850 user manual has a figure showing how to connect a DSP-100 to two separate TS-850 xcvrs.

The manual doesn't have any information beyond this.

Does anyone have any additional details?

Thanks + '73,
Randy WN9D

Ron, thanks for your comment however, having purchased and sold many of these units and with all due respect, may I suggest that you look at recent prices of sold units. If you have Kenwood DSP-100s available at your suggested price of $150 as you indicated, I will buy all of them from you sight unseen and in ANY quantity you have. Thanks again! 73, Dick

That is the going price....I paid 725.00 for mine. I don't consider myself a sucker. If your looking for one at $150.00 you will never own one.

I'm not being a butt, but I wanted one for a long time and I just couldn't get to that price. Finally, I did it....I'm happy, no regrets. I know I will get my money back if I decide to sell it.

73,

John KD7KFT

PS...I received 3 offers to buy at $725 AFTER it sold. Honestly, that is the going price. What else can I say. It wasn't worth a penny less to me. It's called free market OM. :)

Have a good one!

We can get this unit here for about 400?, more or less $565USD.

Of course it can be cheaper. It can be offer.

I guess no one knows what tongue in cheek means....I know why you sold it so fast, thats the price and they are in demand....my response was aimed at the individual that suggested 150.00 was the going price and that 725 was ridiculous....I guess no one got that....no more attempts at humor for me....

yup ... it absolutely went over my head in the heat of receiving many messages that I was trying to rape someone on the group and overcharge for the DSP-100. I appologize for my initial response to you. Of course it was an attempt at humor. I was just too dumb to pick that up!

Well with that gents DSP-10 unit price and speed setting record it looks like I will have to go to the garage and take some snappy pictures of my unit (in the box and wrap) and quickly put it on eYeck before the price drops.
Haven't had to used it in over 3 years, the latest I-PAN/DSP setups in conjunction with the TS-850 are fantastic and I new used the TX audio portion anyway.

I guess it just depends how bad someone wants something.

I listed a Zenith table radio on eBay at work for a customer, and that radio went for $2750. We put a $200 reserve on it and wasn't sure it would go that high, due to the condition of the radio. Within 2 hours of listing it, it was at $2000 and had one offer of $700 for the radio or $600 just for the case. 73

Point well taken Paul but when a group member questions your motives with the entire group, one may feel a bit defensive. I did! :) Anyway, you are right of course and maters like this should indeed be reserved for private email.

73,
Dick

All,

I have been overwhelmed with the amout of stuff that I have to move to Oahu. Therefore, I have decided to sell my Kenwood station.

I have the following items for your consideration:

Kenwood TS-850SAT with SSB and CW filters, upgraded DSP chips, etc. $795.00 + shipping with original box

Kenwood DSP-100, $725.00 + shipping. No cables.

MC-60A, new never used. $115.00 + shipping with original box

Kenwood TL-922, absolutely mint condition, $1,150.00 + shipping with original box

Kenwood SW-2000 with three couplers, SW-1,2,3 $225.00+shiping

Kenwood SP-31, original box $95.00+shipping

Kenwood heavy duty power supply PS-53, mint condition. $185.00 + shipping.

I prefer M.O.

73,

John KD7KFT

I will have to take a look when I get home. I believe they are a matched pair.

There are no issues with this unit. It has been modified for 10M I believe.

There isn't a single scratch, blemis, fade, etc. Just as if it were buit yesterday.

John

8010. TS-850 DC-DC converter

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-06-09 14:20:02 UTC
From: vk6gx
Topic: 8010 Message: 8010

Hi All,

I recently suffered, like so many others, the symptoms of a misbehaving DC-DC converter board, i.e. fluctuating power out and ALC levels, all modes, but more severe and of shorter duration at higher power out/carrier settings, even into a 50 Ohm dummy load.
Referring to the groups files section there is some very helpful information there. Firstly I found my HB 13.8V 25Amp power supply had fallen to 13.6Volts, adjusting it back to 13.8V, modified and reduced the severity of the power fluctuations. Further reading suggested reducing the values of R2 & R3 on the DC-DC converter board from 22k to 18k to make the circuit more tolerant of input voltage variations. I removed the RF board and checked all the components on the DC-DC converter, (which is a small board mounted on a 11 pin header), and the associated components on the RF board and finding no problems (the circuit diagram shows C626 & C628 with polarities reversed, they are actually wired correctly on the board), I decided to change the values of R2 & R3 to 18k. The easiest way to do this is to bend the DC-DC board connections so that it lies at a better angle to access the components.
Either replace the existing 22k SMD resistors with conventional 18k types or if you don't have that value handy, bridge the existing 22k resistors with 100k's, to give a parallel combination of 18k.
This modification completely cured my rig of any power/ALC variations.
Thanks, I believe, must go to ON7GO for devising this fix. As a bonus, the rigs display now illuminates the instant that the power is turned on, whereas it used to take up to several seconds on occasions prior to this mod. These DC-DC converter boards are probably in short supply by now, so this mod is worth a try if you have these symptoms.
While you have the RF board removed , if you haven't already done the well known noise blanker mod, I strongly suggest you do. It is only a matter of removing SMD capacitors C618 & C619, both 0.01mfd. The NB will be much more effective in removing both impulse and power line noise, almost as good as the superb TS-830S noise blanker!
To anyone contemplating doing the Inrad roofing filter mod, it is well worth the effort. Not as easy to perform as similar mods for other rigs, but definitely reduces the main drawback of up-conversion rigs.
Good luck & 73, Phil VK6GX.

8011. Hi to all and?

Just joined this group after buying a TS450S/AT getting back into radio after a 15 year break. I have picked up a nice example which is clean and seems to be working all ok.

Out of interest is it possible to work out how old my example is say, from the serial numbers?

I am trawling through all the past posts at the moment trying to get an idea of mods and common problems. So that will keep me busy for a while.

Thanks to all members for the postings a lot of good info on there.

Hope to catch you on the bands some day.

Pete G4YYJ

Near the bottom of the page is the link to TS-850 Service Manual (not the "ads by Google" or "Sponsored Links")
http://www.dxzone.com/catalog/Radio_Equipment/HF_Transceivers/Kenwood_TS-850/

You can find lots of info with a Google search kenwood ts-850 or ts-850 service manual

Have fun. Galen

From: Roland Spoon
Topic: 8010 Message: 8013

Aloha Phil,

I did the Roofing filter as soon as Inrad put them up for sale and like you found it to be the best mod you could ever do to this fine radio. When you can get 3khz away from a S9 signal and not get a scratch and work a S2 signal it just brings a great big smile to me :=). I keep a new spare DC-DC converter board just in case.

> Referring to the groups files section there is some very helpful information there. Firstly I found my HB 13.8V 25Amp power supply had fallen to 13.6Volts, adjusting it back to 13.8V, modified and reduced the severity of the power fluctuations. Further reading suggested reducing the values of R2 & R3 on the DC-DC converter board from 22k to 18k to make the circuit more tolerant of input voltage variations. I removed the RF board and checked all the components on the DC-DC converter, (which is a small board mounted on a 11 pin header), and the associated components on the RF board and finding no problems (the circuit diagram shows C626 & C628 with polarities reversed, they are actually wired correctly on the board), I decided to change the values of R2 & R3 to 18k. The easiest way to do this is to bend the DC-DC board connections so that it lies at a better angle to access the components.
> Either replace the existing 22k SMD resistors with conventional 18k types or if you don't have that value handy, bridge the existing 22k resistors with 100k's, to give a parallel combination of 18k.
> This modification completely cured my rig of any power/ALC variations.
> Thanks, I believe, must go to ON7GO for devising this fix. As a bonus, the rigs display now illuminates the instant that the power is turned on, whereas it used to take up to several seconds on occasions prior to this mod. These DC-DC converter boards are probably in short supply by now, so this mod is worth a try if you have these symptoms.
> While you have the RF board removed , if you haven't already done the well known noise blanker mod, I strongly suggest you do. It is only a matter of removing SMD capacitors C618 & C619, both 0.01mfd. The NB will be much more effective in removing both impulse and power line noise, almost as good as the superb TS-830S noise blanker!
> To anyone contemplating doing the Inrad roofing filter mod, it is well worth the effort. Not as easy to perform as similar mods for other rigs, but definitely reduces the main drawback of up-conversion rigs.
> Good luck & 73, Phil VK6GX.
>

Aloha Phil,

I did the Roofing filter as soon as Inrad put them up for sale and like you found it to be the best mod you could ever do to this fine radio. When you can get 3khz away from a S9 signal and not get a scratch and work a S2 signal it just brings a great big smile to me :=). I keep a new spare DC-DC converter board just in case.

Aloha Bill,

Sorry but once you put the Roofing filter you cannot swtich it in or out you have to remove some surface mount componets that will disable the 15khz filter.

Thanks for the info Galen but mine is the TS450S not TS850. I have got the manual (original) and whilst a service manual would be handy not sure I would want to get my sticky fingers in there. I do not have any test gear so would leave that kind of thing to the pros.

All,

I have been overwhelmed with the amout of stuff that I have to move to Oahu.
Therefore, I have decided to sell my Kenwood station.

I have the following items for your consideration:

Kenwood TS-850SAT with SSB and CW filters, upgraded DSP chips, etc. $795.00
+ shipping with original box

Kenwood DSP-100, $725.00 + shipping. No cables.

MC-60A, new never used. $115.00 + shipping with original box

Kenwood TL-922, absolutely mint condition, $1,150.00 + shipping with
original box

Kenwood SW-2000 with three couplers, SW-1,2,3 $225.00+shiping

Kenwood SP-31, original box $95.00+shipping

Kenwood heavy duty power supply PS-53, mint condition. $185.00 + shipping.

I prefer M.O.

73,

John KD7KFT

I don't own a 450 but the 440 and 850 have a diode you remove to open the rig for full SW range transmit. I did that so I could work 60 meters. I would guess the 450 has the same feature.

I have been doing some thing very similar for the last couple of years. I use the FTDI TTL232R cables. They have the chip built right in the USB cable. All you have to do is make a 2mm header and away you. I have built many of them for friends. I also use one on my FT1000. They really work well!

Subject: [Kenwood] Inexpensive (about $20 shipped) USB to Kenwood Computer Interface

Hi Everyone,

I recently wanted to update my computer control cable on my TS-850SAT to a USB one with RTS/CTS support. It took me a bit of work to get it all sorted out, but the result was worth it, especially with IF-232C units still going for more than $50 on ebay.

This interface should work with the following Kenwood radios: TS-50, TS-60, TS-140, TS-440, TS-450, TS-680, TS-690, TS-711, TS-721, TS-790, TS-811, TS-850, TS-950, R-5000.

I put up a short page on building it at:

http://people.wallawalla.edu/~Rob.Frohne/SDR/USB%20Interface/IF-232%20USB%20Replacement.html

I hope this is of use to some of you, and that it will make doing it much quicker and easier than it was for me.

73,

Rob, KL7NA

Thanks Zack got it will have to programme the memories to hold the frequencies I think or remember to hold the correct buttons everytime at switch on.

Many thanks for your help

Hi every one,im the owner of a ts 850 serial number 2 million.Yes ive got leaking capps and the old dds chipps.The radio is in very good condition boxed,what should i do sell or repair.I did try another car board,old chipps and leaking caps and it worked all ok for a short time,before the dots and dashes ...error.So it may be not just down to just the car board,i dont know.My plan was to restore that board,new dds chipps and replace the caps,then take it from there.Could i have four good old dds chips out of eight.

Regards Shaun

How about confirming where the problem is before going willy-nilly and changing chips that may or may not be bad????

What kind of test equipment do you have? This group is very good at troubleshooting over the internet. If someone hasn't seen it, it hasn't happened....

Clif

Repair it -- it's a great transceiver. Pull the Carrier Unit board with the leaking caps, pack it carefully and send it to Clif at AVVid. He'll repair it reasonably and quickly. Don't mess with the DDS chips until you know they're bad. Clif can verify their condition. But do get rid of the leaky caps ASAP.

I agree with Paul. I have one of the early 850s with the old chips
and have never had a problem. Just because you had the old chips doe
snot mean they will give you trouble. I think if you are getting the
dots and dashes error on the display, it could be the caps in the
display board, and not the CAR board. Check that

8041. FS: TS-850/DSP-100 Combo with KA0KA ESSB Mods on both units.

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-06-18 22:09:11 UTC
From: k1dpm
Topic: 8041 Message: 8041

This is a very late production (60 mil) LIKE NEW TS-850 with low time paired with an excellent DSP-100. Both units have received all of the KA0KA ESSB mods by a well known Kenwood technician to result in outstanding line-level audio for both SSB and AM. Mods preformed on this station can be viewed at http://www.ka0ka.com/. I have the original boxes and packing material for the TS-850 but will ship in another box to help protect its integrity. The DSP-100 will be shipped separately. If you are seeking this setup, you will be hard pressed to find one as nice as this. I have a lot invested in these units but will ship anywhere in the lower 48 states UPS GROUND for $2450 insured. If you would like to check me out, you can view my 11 year eBay feedback history at eBay ID "dick207" I will accept a certified bank check or PayPal. If using PayPal, please submit funds using email address rsmall@maine.rr.com and add 3% to your payment. Units will be shipped the same day funds clear. I do not have a working camera but can tell you that any pictures taken would be blemish free.

Thanks clif,paul and mike for your input i appreciate it.Guess ive read too much info on the dds chips being the culprit of my problems.It would have been great if clif could repair the car board,being in the uk this is not possible,with my lack of experience in repair and test gear,my only option is to send to a company that will do the repair,i know you guys are out there with all the help i need,so i may just send them the car board for repair and take it from there.

8043. Piexx Speech Board

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-06-20 01:22:53 UTC
From: Kevin Nathan
Topic: 8043 Message: 8043

Hi All,

Back in November or December, I can't remember, I bought a TS-850. I bought the Piexx speech board for it but it has now quit working. Does anyone know what the guarantee is on these boards? Or, if it has lapsed, does anyone have a VS-2 you would sell reasonably?

Thanks much and very 73 to all.

Kevin :)

Subject: [TS-850_450_690] Piexx Speech Board

Hi All,

Back in November or December, I can't remember, I bought a TS-850. I bought the Piexx speech board for it but it has now quit working. Does anyone know what the guarantee is on these boards? Or, if it has lapsed, does anyone have a VS-2 you would sell reasonably?

Thanks much and very 73 to all.

Kevin :)

Hello everyone!

I have a small problem and I have to take off the VFO Knob so that I can remove the plastic mask of the radio. Does anybody know what kind of tool do I need? I appears that the head of the screw is hexagonal or something... I don't want to do some damage so I kindly ask you the experienced one. :)

Cheers!
YO3IBW, Dan

Topic: 8050 Message: 8050

Is there an internal adjustment for the processor? I've looked at both the operation manual and service manual and I can't seem to find anything here. I'm using the MC-60A mic and would like to be able to use this with the processor on at times. With no processing and no preamp on at the mic, I run the mic gain wide open and this seems to work well. Turning the processor on is a huge difference and I'd like to back it down and not have to mess with the mic gain. Thanks in advance.

At the point on trying not to sound rude, but you are using WAY TOO MUCH Mic gain I never run mine over 4 so either you have a problem with the mic or you are splattering all over the place. Try a differnt mic and start at 2 on the mic gain and work up from there to get a clean signal use the MONItor to check your audio, then turn on the processor and adjust to about 10 to 15 db of processing. Then check out the MC-60 it should not need to be cranked up so high. After all we want a Clean Signal not a splatter box.

I had set the mic up during QSO with some locals and hadn't gotten any bad reports or complaints. But I tried turning the gain down to "your" setting and there was hardly any output...and yes,I know that you shouldn't expect to be slamming the 100w mark. To get the peaks anywhere near 100w and not letting the ALC go over,the mic gain needs to be at least an 8.By any chance,are you also using the preamp in the mic? Turning the preamp on and setting mic gain to 2 gives me the same result.

I am using a Heil Pro-Set head set with no pre-amp at all. There is a problem with your MC-60 if you have to have the Mic gain at 8. I would use the pre amp in your mic. Are you using a peak reading watt meter? See if ther is a setting for Hi-Z/ Lo-Z and use the Lo-Z Kenwood radios need 600ohm mic impedance.

Hi Rich here,

I have a TS-850 on the bench with the tx light on while in RX (RX is also degraded obviously from the bad diode as well), I have the service bulletins on it and also the pages from the TS-850 site on the web. I am wondering if someone knows of a place where I can get all of the parts. It seems that East Coast doesn't show everything I need and some of the other sites have a 50 dollar minimum. Also, some of the parts are discontinued or new part numbers. Has anyone sorted this problem out and narrowed down one or two parts dealers who carry all of this stuff?

These are the following part numbers I need:

2sk520

lfb01

mi204

rk73fb2a223j

cq92m1h474k

I am also wondering if anyone has had the attenuator go dead, any engagement of the 6 or 12 db buttons and the rx goes dead, before I dig into it, I am wondering if anyone has seen this before. This way I can go right to it and test and then order everything together.

Thanks, Richy N2ZD

You can't compare those 2 mics...very different animals.I'm using the low impedance and not running the preamp.I followed the manual's recommended procedure and am keeping around 6" to the mic.I believe the output on your Heil is much greater than the MC-60 due to a difference in the 2 mic elements. Trust me...the mic works fine OM.

Switch the meter to the ALC and see how far it deflects. If it is going way up past the red, it is too much mike gain. On my '450, I set it with the processor on and the ALC just about half way into the red. Any more than that and it starts sounding pretty raspy. 73

My adjustment is very touchy. I just barely get the mic gain cracked open with the processor on and the ALC marker is taking a beating. I was really hoping to find an internal adjustment to back down the processor level and either find a spot where I could switch it on when desired with no further mic gain adjustment, or at least find a spot that would allow finer adjustment of the mic gain. Right now it's almost on or off.

Have you tried adjusting the ALC meter per the service manual. Maybe someone has been there before and got it wrong.

In CW mode turn up the Car control until the power out gets to 100w. The ALC meter should just have one dot lit. Furthur turning of the Car control will smoothly increase the ALC meter to off scale but the power out will not change.

It that how yours is working?

It's neither one you need to read the service manual.

What is the max power out in CW mode? It should be 100-105w.

Max output in cw is just shy of 100 watts and the ALC is lit for almost the full length at this carrier setting.

I should add to that...when referring to the ALC display in the previous message,I meant that when adjusting as you indicated,the bars were lighting up to almost the end of the red marker associated with the ALC...not the full length of the display.

Ok. The Automatic Level Control (ALC) is working correctly. IE: When the power reaches a preset level (100W) it will not go above that. Any advance in the Car control above that point results in the gain of the TX IF being reduced to maintain the pre-determined level (100W).

The meter merely indicates how much the gain is being reduced. At the point the power reaches max (100W) the ALC starts to operate and the meter should indicate this by showing 1-2 dots. As the carrier control is increased the gain is reduced and the meter indicates the reduction by an increase in meter reading. A 6 dB increase in gain should be full scale ALC.

In the 450 the ALC meter is controlled by the micro-processor. It has to be taught what to read. VR14 sets the reference ALC voltage. The processor stores this as zero. An audio tone is injected and the mike gain increased until one dot lights, again the processor stores this. The audio level is increased by 6 dB and the processor stores this as a full scale ALC reading. The audio is again increased by 6 dB and this is stored as a full scale meter reading.

As you can see setting the ALC Meter requires a calibrated audio signal source, the service manual, and a little time.

OK, so now the trick is to figure out what the true ALC reading is and how to know when there's a good level of audio.My first thought here would be to add the number of bars that the this technique (CW,adjust carrier to 100w)showed that were beyond the first 1-2 (that should have been the correct indication).Will this do as a workaround? Thanks again Clif...it's not easy to get good advice these days.

John and Cliff:

This is an interesting bit. I'm not in front of my TS-850Sat, but I
remember the processor actually leveling out, or reducing the dynamic
range of the audio level... causing less variations in ALC "swing."
With say 6 dB of RF compression set, the processor kept the ALC range
reduced and in-check per se.

I take it the processor in the 450S isn't externally adjustable? But,
I would assume the narrowing of the transmit audio's dynamic range, the
ALC wouldn't "swing" as much, remaining more constricted within the "red
scale." Am I on-track with this logic, as per my 850S experiences?

73 as always.

8068. TS850s ALC Problem?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-06-27 04:39:30 UTC
From: Dan
Topic: 8068 Message: 8068

Hello!

Well I have a delicate problem with my TS850s, to be more exactly with the ALC.
No matter the output power at the peak, with Proc ON and compression around 10db, the mike gain knob is around level 3, the microphone I use is the MC43, the power supply is rock solid on TX around 14V but the ALC is apparently not working OK.

One thing I notice, the power connector is heating when I put my TS850s in TX 100W Carrier mode. Could I have a voltage drop there and made the DC/DC board not working properly?

Another question I want to ask you, what is the explanation that until now everything worked OK, no electrolytic caps are dried or mounted reversed (I've check and replace them with some new ones... And now the problem appeared?

I've made a small video on Youtube where you can see how things are going....

http://www.youtube.com/watch?v=k26aafVbUEk

Thanks for support!
Dan, YO3IBW

You didn't say what the problem is????

If the connector is heating you have a voltage drop. Tighten the pins up. The higher the resistance the more the voltage drops and the hotter it gets.

The problem can be seen on this youtube link http://www.youtube.com/watch?v=k26aafVbUEk

To be more exactly, from time to time on the modulation peaks the ALC drop the output power down to zero and after few seconds the power is going up at normal levels and so on...

Watch the movie above to get a better idea of the phenomenon.

Thanks,
Dan YO3IBW

I don't like the social networks also but Youtube can be a good tool on the net. Anyway I uploaded the movie on my blog so that can be seen also on the non-social networks, hi.
The Address is : http://www.buz.ro/kenwood-ts850s-alc-problem.html

About the ALC issue, if I change the two resistors things could get to normal... The question is, why all this time until now the ALC system was OK and now the problem appeared.

Thanks help!

Because now you have a large voltage drop as evidenced by the power connector heating up.

8077. kenwood ts-450s + icom ah4 tuner

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-06-28 18:25:50 UTC
From: Manuel Wilches
Topic: 8077 Message: 8077

Hello everyone:
I have the little circuit that allows the usage of the Icom AH4 to other radios. I have used it with the Elecraft K2 and it worked like a charm. I now have TS-450S and I have hooked it up the same way. Although the led lights up for a few seconds and then shuts off, indicating a tuned situation, the TS450 never goes on TX when I do it.
I have only found two (2) menu positions that might have anything to do with the external tuner: 31 and 32....

If anyone on this list has the same setup, I would very much appreciate it, if you could share with me your experiece.

I am using a 165 feet inverted L...this is the same antenna I used with the Elecraft K2 + AH4 before.

Thank you and 73
Manuel

Thanks for the help!

The big problem was on the DC/DC board and the solution was to put in parallel two 100K resistors one over R3 and one over R2 so that the value to be around 18K each other.

I also resolved the heating problem of the connector by cleaning and tighten the pins inside.

Thanks once again!

73's and see you on the bands!

From: Kevin Nathan
Topic: 8080 Message: 8080

Hi All,

I have been very pleased with my 850SAT but I find I am missing six meters a lot. So, I am going to offer it to the group in hopes someone might be interested. Here is what I have. I have the TS-850SAT with the 250 Hz narrow CW filter in the 455 IF, manual mic and power cord. As extras I would let go with it for some consideration I have the computer interface from HoseNose.com, an amplifier keying and ALC cable, and a packet/RTTY cable to fit a Kam TNC I bought from Packet Radio.com. I did put the Piexx speech board in the radio but it seems to have stopped working. If anyone is interested in it I also have the W9GR DSP-3 that I would include or sell separately.

Here is how I would break down the prices:

1. TS-850SAT w/mic, cord and manual, $700

2. Same as above with computer interface, packet radio cable, and amplifier keying and ALC cable, $740

3. For the W9GR DSP unit, $150 or add $150 to the previous prices for the package deal.

I thank you all for reading this and hope this might find a good home with someone. Take care and very 73.

Kevin :)

You can still get RLS135 from Kenwood parts or you can use 1SS356 which is also made by Rohm
Hope this helps,
Jerry

8088. TS-850 IF OUT 1 Jack

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-07-06 16:30:28 UTC
From: kremper4-850@yahoo.com
Topic: 8088 Message: 8088

For what it's worth...

I couldn't find the IF OUT 1 jack identified on any of the TS-850 Service Manual schematics I have, so I pulled off the cover and traced it out. That jack is on the RF Unit X44-3120-00; see the Service Manual page 121, coordinates L1. The jack itself is labeled "J7" -- that's the IF OUT 1 jack. It's connected via coaxial jumper cable W2 nearby to Connector 26 located toward the left-front of the aforementioned board (with the front panel facing you).

The output of Mixer Q15 feeds that IF OUT 1 (7) coaxial jack.

73,

Paul / N1FB

Topic: 8090 Message: 8090

When I first came into amateur radio, all of the rigs had no DSPs and because of that those rigs are sentimental to me - i.e. prefer them over the DSP ones.

1 - I am thinking of going for either of the above and would appreciate comments,opinnion and/or experience on eother or both.

2 - What about the Kenwood TS 480SAT - 100 watt version - as opposed to the both the said?

3 - What is the difference between the Kenwood TS 570s and 570SG?

Thank you everybody.

Hanafi - 9W2TZ

8091. TS-450S no SB or AM

My trusty TS-450SAT seems to have given up on me.

I'd appreciate any advice on this problem.

Receive is pretty deaf all of a sudden, even tuned to WWV I have to turn the volume all the way up to hear anything at all. No signal moves the S meter anymore, it's always at 0.

In any band in any AM mode (USB, LSB or AM) the ALC, Power and SWR meter remain at zero when I transmit and the unit only draws 2amps on any power setting. Even when I whistle into the mic or thump it nothing happens with the power draw or meters.

In FM it'll draw the normal amount of power (6A minimum 17A max) but the ALC meter maxes out. The power meter seems to work normally in FM.

I'm fairly sure that the mic is good because when I put the unit in VOX mode I can make it go into transmit real easy by talking into the mike or whistling at it.

I've torn the thing down and put it back together and found no obviously burned up bits or bad smells or anything that looks grossly abnormal to me.

The only thing slightly abnormal I found was a little glass tube which is the next thing in line after the antenna connector. I think it's a surge absorber but I'm not sure. The glass is slightly smoked on the inside. The circuit diagram shows this glass tube as two triangles pointed at each other with a line between them. I've never seen that one symbol and can't find that symbol anywhere on the internet.

So for the moment I'm stumped. Other than boxing it up and shipping it off to IRSD I don't know what to do with it.

Hi All,

I offered this rig last week but have revised my offer and want to note it here again. I have the following for sale:

Kenwood TS-850S with built-in tuner including the 350 Hz CW narrow filter in the 455 IF, original mic, manual and power cord. I will also include the amplifier keying/ALC cable, LCU-3K computer interface from HoseNose.com, and a radio to TNC cable for Kam TNC from Packet Radio.com. Serial number of the transceiver is 61200108. It is from a non smoking environment, works very well and is in beautiful cosmetic condition.

I am asking $650 for the rig and extras and would like to split shipping if possible. I do not have the box but will pack very well for shipping or will meet someone within 150 miles of the Seattle metro area. I would also consider the rig in trade plus cash for an Icom IC-746 or 746 Pro.

Thank you for reading this and very 73.

Kevin :)

I know of no guaranteed reliable source for those chips, but have seen some advertised for sale on eBay -- for several weeks... (to me, that says something). The price was about $325 for 4 ICs, rougly 40% the cost of a TS-850. Old posts here show that the manufacturer has ceased production, and Kenwood, as well as the Kenwood parts supply houses, no longer stock those ICs.

73,

Paul / N1FB

I read awhile back on this board that these are NLA. Has anyone came up with a source? Also is it only the old ones that are failing or do the new ones also fail?

8100. Kenwood TS-850sat/ DSP-100 for sale

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-07-09 13:21:57 UTC
From: Dale
Topic: 8100 Message: 8100

Hello all, I have a perfect working TS-850sat with auto tuner. And the much sought after DSP-100 with all hook-up cables, these are getting harder and harder to fine in this condition. For radio I have the Orig box, DC cord, Amp cable, Inrad #2100 SSB filter installed. Rig has the Improved 66312 DDS chips from factory. No mic or manual. Ser# 4100xxx. Radio is an 8+. No marks on the face and sides, with just normal wear marks on top of radio.

The DSP-100, Has No box, but all hook-up cables. An 8 or 9. Very few small marks on the unit, Ser# is 21100xxx. Neither units are modified. From Non-smoking home. Price $1150 firm + shipping. Will consider trade for TS-870S or FT-1000MP This is a great price for this outstanding combo. Thanks for looking, 73 Dale KD5UVV

8101. KENWOOD TS 690 AND TS 570S

From: eagle one
Topic: 8090 Message: 8101

When I first came into amateur radio, all of the rigs had no DSPs and because of that those rigs are sentimental to me - i.e. prefer them over the DSP ones.

1 - I am thinking of going for either of the above and would appreciate comments,opinnion and/or experience on eother or both.

2 - What about the Kenwood TS 480SAT - 100 watt version - as opposed to the both the said?

3 - What is the difference between the Kenwood TS 570s and 570SG?

Thank you everybody.

Hanafi - 9W2TZ

8102. TS 850 white noise

Hi all, I have an old ts850. It has been modified with all know improuvement but on receiving show a high audio noise and the s-meter remain (without attenuator) at 2-3 level. Without antenna the s-meter goes to 0 and noise became low. I use also an old icom ic 751 but with the same antenna the problem doesn't appear. Problem of intermodulation/mixer saturation or other?
Thans for reply.
Roby, I3BZK, Italy.

Regarding the DDS chips...is it primarily the old ones that fail or the new ones? Do you know when they do fail, old or new, must all 4 be replaced either old or the new ones? I am asking because I ordered 4 a couple of years ago which I didn't need. I already have the newer chips im my rig and was trying to make a decision whether to let go of them or not.

Hi,I have just bought myself a TS-850SAT,its in exceptionally clean condition and is one of the later 5 million serial number models :O)
The TS-850 has no optional filters fitted & wondered if anybody could tell me the bandwidths for all the different combinations of the standard filter settings??
As the only mention in the manual is of the 8.83Mhz & 455Khz both set at 2.7Khz which will produce a bandwidth of about 2.4Khz.
Can anybody tell me what other combinations will produce???
Thanx in advance & 73's ,Shaun :O)

I've got one rig with the older DDS ICs and another rig with the newer ICs. I know of no way to predict failure for either chip series -- or for any other component in the rig. What could hasten the demise of one or more of the DDS ICs is the well-known problem of leaky electrolytic capacitors on the Carrier Unit PC board.

I have what appears to be a DDS chip problem with my Kenwood TS-690S, its been sat in its box for a long time now as have only just moved back to the UK, my question is can I simply swap the Car Unit from a known good TS-690S/450S to test that this is the case, from what I can see the CAR Unit is the same in the 690 and 450

Kind Regards

Adrian

Hi All,

I offered this rig last week but have revised my offer and want to note it here again. I have the following for sale:

Kenwood TS-850S with built-in tuner including the 350 Hz CW narrow filter in the 455 IF, original mic, manual and power cord. I will also include the amplifier keying/ALC cable, LCU-3K computer interface from HoseNose.com, and a radio to TNC cable for Kam TNC from Packet Radio.com. Serial number of the transceiver is 61200108. It is from a non smoking environment, works very well and is in beautiful cosmetic condition.

I am asking $650 for the rig and extras and would like to split shipping if possible. I do not have the box but will pack very well for shipping or will meet someone within 150 miles of the Seattle metro area. I would also

consider the rig in trade plus cash for an Icom IC-746 or 746 Pro.

Thank you for reading this and very 73.

Kevin :)

Just buy the Inrad 2.1 filters for both IF's for SSB
or the 500HZ for CW. You'll be very Happy. And while your at it install the Inrad Roofing filter. I would not worry about the differnt combos of filters just get matched Inrads and dont bother with the Kenwood filters. Inrad should be able to answer all your questions on filters. They make the best filters avaible anywhere period.

I'm not sure exactly what you want to know. My 850 has buttons for 8.83 MHz and 455 kHz filter settings. The 8.83 MHz can be cycled through 6 kHz and then 2.7 kHz, 500 kHz and 270 kHz according to the front display. The 455 kHz filter can be cycled through 12 kHz, 6 kHz, 2.7 kHz and 500 kHz. However, the lower of these depend on what filters you actually have installed - i.e. if you have a 1.8 kHz SSB filter installed for 8.83 MHz, then the "2.7k" display is really for the 1.8 kHz filter, etc. I think it's just the 6 kHz and 12 kHz settings that aren't specific to the filters you actually have installed.

The best thing to do is go to Inrad.net and look at what they have available.

The TS850's have two open slots for 8 MHz filters and one open slot for 455 KHz filters. You select the combination you want from separate selections on the front panel. I typically set them up with a narrow SSB and a narrow CW filter in the 8 MHz IF and depending on the rigs' primary use, either the cw or SSB narrow filter in the 455 KHz IF.

As far as which filters to get (bandwidth choices), that's up to the owner and what their interests, operating skills and location dicate. I find a 2.1 KHz SSB filter is great for SSB contesting and a 500hz cw filter is a good general purpose cw filter. YMMV.

73,

Terry

Hi Guys,all 3 off you missed my point,I do not have any optional filters fitted in my TS-850,nor do I want to know what the bandwidths would be even if I did have otional filters,which I don't.
What I want to know is what bandwidths can be acheived with different combinations of the standard filtering options of the 8.83Mhz & 455Khz settings that my standard TS850 has & as illustrated below ????

8.83Mhz Filters 455Khz Filters

6K 12K

2.7K 6K

2.7K

If you have no optional filters installed, then I think you have 6K and 12K
and that's it.

Roland, how is the roofing filter working out? I know you initially
liked the results. Have you out anything new or different? I wonder if
anyone else on the list has installed one. I'm thinking about it.

Hi Zack :O) it says on page 33 of the manual that if the 8.83Mhz & 455Khz are both set at 2.7Khz
then it will produce a bandwidth of about 2.4Khz.
Surely there must be other combinations for SSB aswell with just the standard filtering??
Cheers,Shaun

8124. Inrad Roofing filter Mod

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-07-10 22:23:06 UTC
From: Roland Spoon
Topic: 7814 Message: 8124

This is for the many questions I have had concerning the Inrad Roofing Filter Mod. All I can say is after 2 couple of months of using this mod I do not see how I lived without it. The Receiver is just plain fantastic I worked TL0A who was S2 4 KHZ away from A huge Pileup on 20 meters. The radio is as good as any I have used lately and that includes a Elecraft K3. This weekend will be the true test in the IARU contest (the first since the install). If you have not installed the mod yet dont wait (who knows the price might go up) Order it today. Even if you dont put any other filters in THIS IS A MUST for the 850 too bad Kenwood did not think of it when they built designed it.

73,
Roland AH6RR

Hmm ... I don't really know for sure because I have the 2.1 kHz and 400 Hz INRAD filters in my radio. I haven't tried it withuot the filters. :-(

If you switch from the 6 kHz position to the 2.7 kHz position and it sounds like the noise decreases or the bandwidth reduces, then you're probably seeing 2.7 kHz filtering. I don't think you can get any narrower than that withoug putting in the additional filters.

I've heard so many raves about the INRAD roofing filters that that will probably be my next addition.

8126. Help with TS440S

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-07-13 00:46:41 UTC
From: Mario Aviles
Topic: 8126 Message: 8126

Hi Group:

I had my TS440S in storage for some time and decided to try it our this weekend. Everything seems to be working fine, except the fact that when I change bands, by pressing the band up down button, the frequency does not come back to the previuos frequency. For example, I am on 7,100 and then change to 20 meters the frequency shown is 14,100, when I switch to 15 m the frequency shown is 21,100 eventhough I might have been on another frequency on 20 and 15 m. I suspected the lithium battery but it is Ok as it still holds all the frequencies stored. I did reset the radio turning it on pressing the A=B button and nothing happens.

Any ideas on what to do?

I would suspect one or more of the PC board interconnect connectors has developed some pin / socket corrosion.
You might try disconnecting and re-connecting all of them in the radio, and perhaps a very very small dose of De Oxit on any that show signs of corrosion or oxidation.

I would say that the memory battery is shot replace it and things will be just fine again. I have owned a 440 and it did the same thing. Replaced the battery and bingo back to normal if I was last on 14.180 when I went back to 20 it was on 14.180.

Thanks to all that replied.
Roland, on your suggestion to change the battery, I wonder if you did this yourself or if you sent it in to have it replaced by Kenwood? I read the manual on this issue and they suggest to send it in since this is a CMOS sensitive issue. It seems to me it would be easy for me to replace it, but you never know. It is a big issue for us outside the USA to send equipment for repairs.

Your battery is fine. If it turns on at 14.100 everytime it is powered up the battery is gone.

What you are describing is the way the TS440 works. It does not remember the last frequency on each band. You have to go to the TS450 to get that.

8134. TS-690S receiver problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-07-13 15:32:04 UTC
From: bayuh@yahoo.com
Topic: 8134 Message: 8134

Dear all,

I just bought a new but old stock TS-690S couple of months ago. It went flawlessly until few weeks ago, when I turned on the radio in a saturday morning.

The problem: when it turned on after a long period of "off" time (more than 20 minutes), the S-meter jump up to maximum and then slowly goes down after couple of minutes. The situation is just like we turn the RF gain counterclockwise quickly and then turn it back clockwise very slowly. After couple of minutes the rx is operating normally.

Any advice, anyone?

Thank you

Best & 73

Bayu,
Turn-on is pumping up the AGC but the AGC decay circuit is not working. I had a TS-950SDX in the shop a while back that did this and it was CD4066 FET switch that controlled the AGC timing ranges that had failed. I would start looking around the AGC first. Without pulling the schematic the TS-690 may have more than one AGC loop. I know the TS-950SDX did. It will be the AGC loop that drives the S-meter circuit. Does the S-meter fall fast when you switch the AGC to OFF on the front panel?

Hi Carl,

Thanks for the advise, TS690S does not have AGC off, only slow and fast, unfortunately.

I will read on the AGC circuitry and try to locate the faulty components. Fyi, if I turn the RF Gain fast to the ccw/left when the signal meter is still peaking, the signal wnet down fast for a while before went up again and follow the very slow decay (its like heating the tube filaments....:)

May be something wrong also in RF Gain circuit?

Thanks

Without pulling the schematic the TS-690 may have more than one AGC loop. I know the TS-950SDX did. It will be the AGC loop that drives the S-meter circuit. Does the S-meter fall fast when you switch the AGC to OFF on the front panel?

Dear all....

Good news. Upon close examination on IF and RF board and some fixing, the RX went back to normal!

Procedure were:

-disconnect power supply
-open all screws and connectors in IF and RF board -start with AGC circuit.
-Found a broken capacitor C105 in IF board (AF output) 470uF.
-Changed with stock Capacitor (well I have only 100uF available but it should work with some compromise)
-secure all screws and connectors back.
-turned the radio on, and Voila!

It works normal again. However, I am still not sure how a broken AF Capacitor affecting the RX with such symptom.....

Thanks
73

Subject: Re: [TS-850_450_690] Re: TS-690S receiver problem

Hi Carl,

Thanks for the advise, TS690S does not have AGC off, only slow and fast, unfortunately.

I will read on the AGC circuitry and try to locate the faulty components. Fyi, if I turn the RF Gain fast to the ccw/left when the signal meter is still peaking, the signal wnet down fast for a while before went up again and follow the very slow decay (its like heating the tube filaments....:)

May be something wrong also in RF Gain circuit?

Thanks

Subject: [TS-850_450_690] Re: TS-690S receiver problem

Bayu,

Turn-on is pumping up the AGC but the AGC decay circuit is not working. I had a TS-950SDX in the shop a while back that did this and it was CD4066 FET switch that controlled the AGC timing ranges that had failed. I would start looking around the AGC first. Without pulling the schematic the TS-690 may have more than one AGC loop. I know the TS-950SDX did. It will be the AGC loop that drives the S-meter circuit. Does the S-meter fall fast when you switch the AGC to OFF on the front panel?

Hi Bayu

I had the very same problem on my 690 with the symtoms you suggested. The audio output cap broke open and spilling its guts onto the IF board. I replaced the cap and cleaned the board with Servisol (switch cleaner spray) and a toothbrush and left in the sun for a day to dry out. I'm sure the electrolyte from the cap caused the problem. Been working well for about 3 years now.

Regards

Rob

Hi Rob,

QSL,

yes maybe you are right, I just suspect that the AGC voltage got affected somehow, but not so sure how. I just use alcohol 90% to clean up the electrolyte.

Btw any suggestion to open the black connectors with white, multiple pair of wires? I did not remove it during my repair, since I am not sure how and did not want to break the wires.......:)

Best
Bayu

If you look closely where that cap leaked you will find the RXB, TXB, AGC, and ALC lines as well as several others. That stuff it leaked is conductive and can ground or short what it touches. It also damages thru holes in the board. Alcohol doesn't do a very good job by itself, I use a toothbrush and Carburetor Cleaner from the auto parts store. It has Xylene, Acetone, and Alcohol and does a very good job. It also eats plastic, be careful.

I just spent 2 hours cleaning up the mess on a 450 the cap left.

8141. TS-690 Frequency off ...

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-07-15 21:55:15 UTC
From: Marc Tessier
Topic: 8141 Message: 8141

Hello group, in respect to my TS-690...
"I was wondering (and I have looked many times at the schematic and service manual) how to put my TS-690 back on frequency as it seems to be about 150-180Hz off frequency?" Now this is both the TX and RX Frequency that is off by this amount, and it is showing higher than it should be at this point. I know I could use the RIT or just learn to live with it, but is that the real solution? I'm sure there has to be a master oscillator or the sorts of that one can tune to get it closer to the actual frequency?...

BTW it is actually closer to 130 Hz higher than it should be, the above was a guess and i just verified its actual inaccuracies now...

Please I am really annoyed by this , other than that the rig seams fine...

Regards,

Marc Tessier - VE3TES

Thanks Clif,

Any suggestion for the black connectors removal? I am planning to do just you and Rob suggesting, but just not sure about that connectors removal. Mine is never opened before.

Thanks
Bayu

I had a TS-950SDX in the shop a while back that did this and it was CD4066 FET switch that controlled the AGC timing ranges that had failed. I would start looking around the AGC first. Without pulling the schematic the TS-690 may have more than one AGC loop. I know the TS-950SDX did. It will be the AGC loop that drives the S-meter circuit. Does the S-meter fall fast when you switch the AGC to OFF on the front panel?

Leave it alone if you don't know how to get it off. You will damage the board and cause more problems.

>
>
> If you look closely where that cap leaked you will find the RXB, TXB, AGC, and ALC lines as well as several others. That stuff it leaked is conductive and can ground or short what it touches. It also damages thru holes in the board. Alcohol doesn't do a very good job by itself, I use a toothbrush and Carburetor Cleaner from the auto parts store. It has Xylene, Acetone, and Alcohol and does a very good job. It also eats plastic, be careful.

Hi...Can someone please point me in the direction of a list of components that you would normally expect to use in overhauling an 850...I have to go in and replace a vco cap, and I though I might as well put commit and do the whole thing..

After seeing some pics posted lately, better safe than sorry... 73...Jordan VE6ZT

Have you purchased any from China/Hong Kong? I would like to find someone who has and can tell me if the chips worked. Also what kind of pricing? They probably won't sell just one, usually min of 100.

HI group:
I just purchased a TS 850S with some minors issues. First the display shows Unreadable numbers. Second the antenna tunner dont tune in 10 meters and i had low power output in this band. On the others bands everything works ok. Im new with kenwood radios.Any help will be appreciated.

Hi, I had similar problems with a friends 850 and here is how i resolved it, i have posted pics in the photo section of the display fix, C18 leaked and damaged the link to both sides of the board causing the display to be unreadable,after cleaning the board on both sides with ISO spray i made the link as you will see in the pics, i replaced C18, C7 and C8, and the display worked good and still does.
Low power on 10mts was a problem with IC1 on the RF unit (SN74LS145N, pin 2 showed low voltage (.890v)it should have showed (11.2v) all other pins showed correct voltage according to schematic diagram, i replaced this IC and all works well now, i hope this info is of help to you as it was to me, thanks to clif@avvid.com for advice and guidence.

Hi Mike,

If you make the mistake of dealing with Buxcomm, let the buyer beware. I purchased a 13 pin din cable that was supposed to be terminated in the 5 pin edge connector for a PK-232 to connect my 850 and my PK-232 together. No way did it match the schematic diagram on their website and they tried to bully and intimidate me when I called for assistance. Those morons insisted that "every cable is tested prior to shipment". BS! And oh yeah I was told that I didn't know how to read the pin numbers on din plugs via a tech support department e-mail. Funny then neither did the communications shop owner sitting next to me (when we checked the cable) know how to read pin-outs either. I guess they were too nutless to say that to me personally.

Old man Buck is a deep dish jerk and he'll play hell ever getting any more money or business from me. So I'd have to concur that old commodore disk drive cables or a pawn shop might be a better source for your cable needs.

Good Luck,
Jack
N3JLW

8158. IF-232 Interface Alternative

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-07-27 18:57:04 UTC
From: a_borg
Topic: 8158 Message: 8158

I recently built an interface I found on the web that will not work with my TS850SAT. It will not pick-up the frequency. The interface is the Computer Interface for the TS-850, without using the IF-232 Level Converter by N6TR. Anyone tried any of the other interfaces that are advertised and do you have full functionality ?

Thanks

Mike

I recently purchased a "lcu-3k" cable at
"http://www.hosenose.com/detail.asp?product_id=LCU-3K" or "http://tinyurl.com/kkk96q"

I use it on the computers serial port (RS-232) with "Ham Radio Deluxe and Digital Master, V4.0 SP4 Build 1901" and it does control the frequency very well. I have only had it a short time but I have found I can also change modes, VFOs, and lock the frequency. It also changes the filters, but not quite in the way that matches what it says it is doing since my filters are not exactly standard but perhaps the can be altered. I am still learning about the software.

Hi Mike

It has been posted here before, but go to eBay and do a search for G4ZLP.
He makes a great interface, and the price is right. I have 3 of them here
(2 on TS-450SAT's and 1 on a Yaesu). Six days shipping from the U.K. 73

Forgive me but I just had a terrible thought. Since you mention only that the ability to change frequency doesn't work, are you sure it is a problem with the interface and not the radio?

Does a nearby fellow ham or radio club member have an interface you can try for a day or two to be sure it is an interface problem before you invest in another interface?

Hello Mike

Have You tried different Com port settings on the program that controlls the interface ?
I use a interface (homebuild) using a Max232 for level conversion and use the settings 4800,N,8,1 with DTR on and RTS on and I tried different setting before it worked Ok.
Works fine with most programs .

Do you have your computer software configured with RTS "Always on"? This is necessary with many interface/software combinations.

Hi people,when were the TS-950SD range of HF radios produced?
Can't find anything on the web relating to when they came onto
the market & how long they were made for.
I can only presume they were in production 1988-1992?? by their appearance at a wild guess.
Mine is serial number 10590966 if anybody has an idea when it could of been produced then I would be very gratefull,cheers in advance,Shaun :O)

Hi
I was intrigued by the mention in the owners manual that you can connect up two TS-850 transceivers as master/slave. Has anyone ever done this and if so does this give you the equivalent of a dual RX transceiver ?
I'd be grateful for your experience as I am ianterested in going dual RX but don't want to sacrifice the excelletn 850.

Kenwood has always been very good about service manuals being in the hands of dealer when a new radio arrives. The service manual on the 950SDX is dated 3/92. So that's very close to when the SDX came out and of course the SD production was stopped before that...

8174. TS-450SAT problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-07-31 22:43:16 UTC
From: Tom Osborne
Topic: 3583 Message: 8174

The antenna tuner in my '450 just quit. It worked, then it didn't any more.

Set it up to work manual, and nothing happens when I turn the VFO dial or the VFO/CH knob. Just stays the same. Changed all the settings on CAR and PWR knobs to no avail. Popped the top and checked the coax and other plugs and all seems OK.

The tuning motors don't do a thing. Any ideas? Thanks and 73

Hi Clif,& thankyou for answering my questions so promptly :o).
So we can ascertain that the TS-950SD was in production between 89-92,just odd that the information regarding production dates of this classic transceiver is not very forthcoming on the web,so I wonder in what year my TS-950 with serial number 10590966 was manufactured? Anybody have any idea? Shaun :O)

Hi
I was intrigued by the mention in the owners manual that you can connect up two TS-850 transceivers as master/slave. Has anyone ever done this and if so does this give you the equivalent of a dual RX transceiver ?
I'd be grateful for your experience as I am ianterested in going dual RX but don't want to sacrifice the excelletn 850.

The antenna tuner in my '450 just quit. It worked, then it didn't any
more.

Set it up to work manual, and nothing happens when I turn the VFO dial or
the VFO/CH knob. Just stays the same. Changed all the settings on CAR and
PWR knobs to no avail. Popped the top and checked the coax and other plugs
and all seems OK.

The tuning motors don't do a thing. Any ideas? Thanks and 73

Hi Dave

There's no function like that in the '450. In the menu, you set the tuner for either 'auto' or 'manual'. I tried it both ways. It's been working fine for about 3 years, and just decided to quit. 73 and thanks.

I have a TS-450S and there IS a thru/auto setting if that is what we are debating.

Before it "just quit" had you been in the menus? Specifically the one where you set the filters available? If so did you turn on #1? That tells the radio you have an AT300 (external tuner) connected and at the same time it disables the internal tuner.

Hi Clif

No, #1 was still set to 'off'. I turned it on then back off again, but still the same.

Sometimes when I hit the 'Auto' and 'AT Tune' buttons, it doesn't even key the radio. Then when I hit it again, the radio keys, but the tuner does nothing--the SWR stays way up. Thanks

I have read the posts here regarding the 850 filters and nothing really definitive for me. My question is, do the filters really make that much of a diffrence? I'm using a Timewave 59+ dsp and I think it's quit effective. I wish that there was an 850S user that had the 59+ also that could give comments using the 59+ versuses the add on filters.

I don't really want to waste money if there's no definitive difference. All opinions wlecome .

Thanks

the 59+ (which I have) is a AF DSP unit....the filters are in the IF....world of difference....if you are interested in CW get the 400 hz filters, one for each IF....I use INRAD, and I had the 1.8 for SSB, but found it a little too narrow for me....

I use a Clearspeech external DSP unit, which is also an AF DSP. Works well at getting rid of the noise. I have both the 2.1 and the 1.8 filters and they help iin crowded band situations, but I agree, the 1.8 is a little narrow for extended listening

It probably depends on your ear and what you want to do. For CW a 500 or 400 hz filter, depending on your preference, would probably be best. For SSB, if you want to contest, and don't care if everyone sounds like they are talking into a tin can and a string, get a 2.1 or 1.8 filter. If you use the rig for general communications, forget the filter and use the slope tune. Personally, I use the slope tune because when I talk with someone I prefer to hear his natural voice instead of a voice that sounds like it is coming from a robot.

Dennis,

  Your response is probably where I fall at. The slope tuning seems to work fine. I'm sure the IF filters are more effective, but I like to hear and examine other opinions also. Thanks to all the guys that commented. I greatly appreciate all the comments and tid bits.

I like two 400 or 500 Hz filters for CW. The 250 or 270 is too narrow for me. Depends on what your operating practices are. I do like the 1.8 SSB filter and I use it mostly to tune for CW signals. I have not tried the 2.1 filter. I have Kenwood filters in one radio and INRAD in another.

I think Dennis is right on the money when he tells you that the slope tuning works for general communications. However, if you are a CW op, I think you will want the filters.

Ok here goes, External DSP Filters are OK but do not stop strong signals that are up or down the band that can block a weak signal you want to work that is where the IF filters come in. The first filter you should buy is the Inrad Roofing filter even if you do not buy another filter the Roofing filter is a must. It prevents very strong signals from causing intermod distortion in the front end (that scratching sound that blocks a weak signal you are trying to work even with the DSP in). Then if you are so inclined add the other filters I personaly run the Inrad 2.1KHz in both IF's for SSB. With this combo of filters I can work a S1-2 signal 3 KHz from a S9++ and not get a scratch. Try that with a DSP alone and it will never happen. If you work DX,contests or emergency comms Filters are a must have but if you just ragchew then you wont need them as long as the have a S6 or better signal. Of course the addition of filters make the radio worth more :=)

Hi Mike,

I'm a relatively new owner of a TS850SAT that has the optional 1.8KHz SSB & 250Hz CW filters. I've never owned an outboard AF filter of any type. While such a device isn't a bad thing, none of them are inside the AGC loop.

This means that any interfering signal inside the IF passband that is stronger than the desired signal will cause the receiver to desense. The greater the difference in signal levels, the greater the desensing. AF filters will be most effective when the interfering signal is no stronger than the desired signal.

8194. TS-850 - problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-08-04 17:24:50 UTC
From: iz1mkz enrico
Topic: 8194 Message: 8194

Hi,
I just had a QSO on 7 MHz and everything was normal.
Switched to 14 MHz and could not resolve the stations - audio sounded like the wrong sideband.
Switched USB/LSB several times, no change.
Went to 7 MHz, everything fine.
Returned to 14 MHz and no audio - just the AF amplifier hum.
Same on every other band.
The receiver works on AM and FM, however. On SSB, it's dead.
The S-meter bar deflects normally indicating that the first stages are doing their job, but no audio.
On transmission, both the radio's wattmeter and my external tuner's meter deflect regularly. Did not check the transmitted audio quality.
Any idea out there?
Thanks!

Enrico iz1mkz

8195. TS-850S(AT) for sale

Yahoo group: TS-850_450_690 (2006 — 2009)

From: kremper4-850@yahoo.com
Topic: 8195 Message: 8195

I've decided to make some room in the radio shack, so one of my '850s is going:

FOR SALE: Kenwood TS-850S(AT) transceiver (S/N 21200904), excellent condition; low operating hours. Carrier-board capacitors replaced by AVVid. Rig equipped with built-in antenna tuner; Kenwood YG-88SN-1, and optional CW narrow YK-455CN-1 and YK-88CN-1 filters. The rig incorporates several modifications known to benefit its operation: 1) An added CW key jack to accept an external key or keyer; 2) Noise Blanker mod; 3) Extended frequency coverage; and 4) CW MONI adjustable from the front panel; 5) CMOS battery relocated; 6) Added jacks to accept an external receiver and transverter. Kenwood PS-52 Power Supply (S/N 21100212). Manuals included: TS-850S Instruction Manual; TS-850 Series External Control Instruction Manual; PS-31/PS-52 Instruction Manual. Original double shipping boxes. As package only, $875 plus shipping and insurance. USPS money order or cashier’s check.

73,

N1FB

8196. Where and how to look for a Kenbwood DSP 100 at reasonable price

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-08-13 13:18:44 UTC

Topic: 8196 Message: 8196

Dear all,

I am new to this group. I am a recently licensed HAM and have acquired a NOS Kenwood TS 450 SAT. I am now looking for a DSP 100 to hook up to the HF rig but am starting to learn that this is a relatively difficult to find item. Does anyone know or have any which you like to part at reasonable price or is there anyway one can construct a similar piece using currently available parts?

Many thanks and best regards

Topic: 8196 Message: 8197

James,

I'll give you my .02 worth of experience. The DSP-100 is pretty rare. In that individuals who use them tend to keep them for a very long time. I don't know what you personally think a reasonable price is. That is usually different for each individual. Since they are hard to come by, they usually command a fairly high price.

I bought mine on e-bay some time ago. It didn't have any of the cables, etc. I acquired those later, which are hard to find as well. I paid $600.00 if I recall as a buy it now option. I just sold mine to a fellow in Ireland for $650.00

I have seen them as high as $750.00. Just make sure they have the cables, etc. It took me about 4 years to find one. There were other units that were available at the time I was searching but I didn't have the money.

I don't know anything about building one and if you have those skills, parts, etc. then I would say go for it.

But I suggest you save your nickels and dimes and eventually one will come your way.

These units are older technology, there is nothing wrong with that. But, from my perspective, I had a shack full of older stuff that I had always said I will get around to fixing that some day. It never came. Time, money, job, etc. all played a part. For me, I plan on obtaining a K-3 that has built in DSP and an L-Pan adaptor which gives you a nice visual display of the freq spectrum.

Best of luck in your search!

73,

John KD7KFT

Hello everybody!

Did anyone of you had problems with the ACC1 connector on you're TS850s? I'm trying to do CAT with my Kenwood and I can't establish a connection with my computer. We try almost everything and we think that the problem could be the transceiver.

if acc1 (without turning my rig around) is the 6 pin, then yes it works

6 pin cable is the same as commodore 64 floppy drive cable, if232c is required (or a clone) and of course a open serial port (or usb to serial adapter) to talk to it

4800,8,n,2 for settings on all older kenwoods. not sure about the 480 and 2000 models

Ok, thanks for the fast reply. I know that there is necessary an interface between the rig and the computer. We made one using the MAX232 CI and we try also another solution using an CI capable of sending TTL signal to the TS850s and get connected on the USB port. Both results are the-same... :(How can I check if the ACC1 port is working or not? Any ideas? Thanks once again.

Have you tried your cable on another Kenwood radio? I have made 5 or 6 of the interfaces using the MAX232A chip and never had any problems. Dave, to answer your question, the TS2000 uses 9600,8,N,1. The circuit I use is in the files section called "max232ctrl.jpg"

I've found a post (http://groups.yahoo.com/group/TS-850_450_690/message/3910) related to my problem that provide me with this information:

I have learned from the 850 Service Manual, that one should expect to
find the following DC Voltages on ACC-1 port.

TXD 0.2 (two tenths volt)
RXD 5.0
CTS 5.0
RTS 5.0

so I have measure also the voltage on the ACC1. I've got,

TXD 0.14
RXD 4.89
CTS 4.89
RTS 4.89

What do you think?

Have a nice weekend, 73

8210. Re: [TS-850_450_690] Re: CAT connector ACC1

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-08-15 20:13:05 UTC
From: Dave ve3wej
Topic: 8200 Message: 8210

sounds like the same voltages (close enough to me)

---

find the following DC Voltages on ACC-1 port.

TXD 0.2 (two tenths volt)
RXD 5.0
CTS 5.0
RTS 5.0

so I have measure also the voltage on the ACC1. I've got,

TXD 0.14
RXD 4.89
CTS 4.89
RTS 4.89

What do you think?

Have a nice weekend, 73

This upgrade capability makes the Kenwood TS-850S's value shoot to the roof. Imagine having the capability of the new rigs ie, Flex Radio 5000C in your so called old technology Kenwood TS-850S. I'm glad I have the 850S.

That glass tube is a surge absorber. It shorts to ground when the voltage exceeds the device's rating. By shorting to ground, it protects the rest of the radio from high energy spikes such as nearby lightning strikes. If you can, try unsoldering it or simply clip the lead (be sure to leave a little wire on both sides in case you want to repair the cut). Now, make sure you are grounded because once you do this there is no protection to your receiver's front end.

Attach you antenna or even a piece of wire to your input to see if WWV comes back in.

If the recive sensitivity goes back to normal, you've found the culprit. It probably shorted out to protect the rest of your radio. Get a replacement before you operate any more. Otherwise, check continuity across the fuse in both directions and solder back the cut if it looks good.

See the picture on the front page of this Yahoo group? It is a shot of the blown absorber on the TS-850S.

--- In TS-850_450_690@yahoogroups.com, "huweyii" <misc@...> wrote:
> The only thing slightly abnormal I found was a little glass tube which is the next thing in line after the antenna connector. I think it's a surge absorber but I'm not sure. The glass is slightly smoked on the inside. The circuit diagram shows this glass tube as two triangles pointed at each other with a line between them. I've never seen that one symbol and can't find that symbol anywhere on the internet.

Hi Syawal,

I will share what I think you are asking, then if you have any further questions let me know. The TS-850 uses an RCA connector for the IF Port. The LP-PAN uses a BNC port. I used an cable with RCA at both ends, then used a BNC adaptor for the LP-PAN side of things. The LPPAN takes the I/Q signal from the IF Port and splits them into Left and Right sound outputs, which just use standard audio cables into the EMU-0202 sounds card. On the LP-PAN webpage, Larry has a list of sound cards that have been tested. You need a sound card which supports a 96 khz - 192 khz sampling rate. I chose the emu-0202 because it was external and used a USB cable to talk to the computer and since I was running an iMac, I could not install an internal sound card.. The EMU-0202 also has has left/right volume controls so it is easy to remove duplicate images from the band-scope.

On the iMac, I used Bootcamp to boot up under Windows XP. PowerSDR requires .NET to run so I needed to run it under windows. If you look my other video using WINRAD, I ran it natively on MAC OSX using a program called Crossover which allows me to natively run certain windows apps on MAC OSX

I hope this helps. If you look me up on QRZ.com, I have links to the LP-PAN website so you can look all this up

Hi Mike,

Using an expression that dates me, that's pretty groovy!
Albeit w/o the extreme grooviness, there's another way to get a Panadapter married to our Kenwood rigs.

Some years ago, when I was running TS120 and TS130 rigs (same 8.83 MHz IF), I married a Heath SB620 'Scanalyzer' to them. While the '620 was typically configured for Heath's 3.395 MHz IF, the input amplifier can be switched to operate as a mixer. A little arithmetic tells us that all we need is an oscillator operating at 3.395 + 8.83 = 12.225 MHz. For those of us who recall the rock-bound 2m rigs, many used crystals in the 12 MHz rangs. I found a crystal for one of these rigs, marked '146.76' (12.23 MHz fundamental) and built an oscillator that plugs into the 'RF Gen' jack on the rear of the '620. A slight tweak of the SB620's sweep oscillator, and I was almost in business. Since the TS120 and TS130 rigs didn't provide an IF output, I fashioned a simple buffer amplifier inside the rigs and routed the output thru an unused pin on the ACCY jack. Voila! The TS850 (et al) wouldn't need the buffer. I don't know if the input amplifier on the (even) older HO10 can be switched to operate as a mixer.

Thanks Mike,

The biggest problem with using any Panoramic display w/ a small CRT is interpolating close-spaced signals with the Panadapter set for a wide scan. Unlike older rigs that used a Preselector in the receiver frontend, modern rigs use bandpass filters so, I can scan the entire band... I just can't actually *see* it on that 3" CRT! hi!

After marrying the SB620 to my Kenwood rigs, I then found a Kenwood SM220 w/ BS8. It works OK but, I went back to using the SB620 for a few reasons:

1) The CRT in the SB620 uses a long-persistence phosphor, making it easier to see signals that have a low duty cycle (such as SSB & CW).

2) The graticule on the SB620 has markings that are easier to interpolate relative frequency & amplitude.

3) The SB620's input amplifier can also be switched to operate in either linear or logarithmic modes. The logarithmic response makes it easier to differentiate between strong & weak signals.

4) I like being able to monitor transmitted and receive signals w/o having to reconfigure the scope(s). With the SM220, there's no automatic T/R switching between transmit (envelope or trapezoid) and receive (Panadapter) functions. I dunno if the SM230 'fixed' that. I currently use the SB620 for receive monitoring, and the SM220 for only transmit monitoring.

It'd be even groovier if the LP-PAN box & PowerSDR software had transmit monitor (envelope and trapezoid) capability... automatically switched, of course.

8220. Disable AIP?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-08-23 12:01:37 UTC
From: Crownhaven
Topic: 8220 Message: 8220

Is there a way to disable the AIP, but not permanently? I know once it is engaged, you can turn it off via the button on the front panel. And, you can enable it on a higher freq that does not automatically engage it. But, is there a way to make it not engage at all?

I would like to scan through a series of memory channels without listening to the relays engage.

Hi John,

Go check the IF circuitry and see if there is a leak in capacitors into the PCB. Mine had leaked its C104 (audio out) to the PCB not long ago, and had some of the control circuitry shorted each other.

Some members gave me advice on this, and I successfully cleaned up the mess, and finally the radio got back to normal operation.

Mine is a TS-690S, with most of the circuits similar to your 450, except the 6 meter band.

Enjoy, 73

8229. Doing radios southern style - TS850SATs

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-08-24 20:15:44 UTC
From: w8nf
Topic: 8229 Message: 8229

When I was W8NF/4 in Atlanta Georgia, the first joke that locals told about themselves was this: How can you tell when a Georgian is rich? He has TWO Cadillacs on blocks in the front yard.

I treasure my TS-850SAT, but it's been rather unreliable. An old Icom IC-735 is the backup rig, unfortunately it's the one that's been used mainly in contesting. At one point when both radios were nominally functional, I tried my hand at SO2R DXing and contesting and was hooked. But the '735 has horrid phase noise and an easily overloaded RX, making it marginal for DXing and really painful for contesting. My enthusiasm for SO2R was cemented when we tried pseudo-SO2R on Field Day with a pair of Elecraft K3s.

Things like family and a desire for a better antenna farm are the current draws on the budget, so the SO2R dream would have to be accomplished with lesser rigs than a pair of K3s. After some study, I decided it would have to be a pair of 850s, so I set about gathering enough of them to put together two reliable units.

My own '850 had suffered the dreaded DDS chip failure earlier this year, but after the last chip left the hands of Kenwood. So, it's dead, and gonna stay that way.

A ham up north of me sent out a shack cleaning email, and one item was a VERY favorably priced TS-850SAT...the only symptom being the ALC issue. I jumped on it, and was overjoyed to discover it was a 60 million serial number rig with the reliable YM66312 chips in it. I have yet to get to the ALC issue in it, but just that problem, and the CW sidetone mod, and I think I'll have that one on the air.

Just a month ago, I got a notice of a local estate being cleaned out and one of the items was a "tested and working" TS-850SAT, with the usual $700 price tag. Hoping for a recent rig, I asked the chap the serial number and was dismayed to see 31 million come back at me. I explained about the DDS chips and said sorry I'm not interested because an old SN like that was guaranteed to lose a chip in the future, with no known repair path. Bless his heart, he opened the rig up to look at the CAR board. In his email he said "I've got good news and bad new. Good new, the chips have all been replaced and are the new YM66312 chips. Bad news, all the aluminum electrolytics are leaking and have turned the board black and when I bumped one of them, it fell clean off the board, taking traces with it. So this is now a guaranteed dead radio. Since you're familiar with them, maybe you want it as a parts rig?" We struck a deal.

So, I now have THREE TS-850SATs, none of which function. But there are 8 new-style YM66312 chips between the two of them (and three still functioning YM6631 chips) so I think I can backyard-mechanic them into two good radios.

So, how do you tell a rich Oregon ham? He has THREE Kenwood TS-850SATs on blocks in his ham shack.

Once I build a functioning rig out of two basket cases, do I have to put a salvage title on it?

;)

Hi Dave, yes some of the woes of using older radios. I have one of the first TS-850S AT with the old chips. It is 18 years old I think. It is my main rig and I use it everyday and have never had a problem with the old chips. I think just because your rig has the old chips, does not mean you are guaranteed to have a problem, but you never know. Mine has had all the capacitors replaced last year, so I don;t worry about leaking either. I hope you get a working unit from your three rigs. Keep us posted with how it goes.

73,
Mike, N4GW

Check the connection between the SO-239 and the circuit board. Mine had a cold solder joint that re-soldering fixed. As I understand it, this is common.

8237. Board/parts commonality between TS-690 and TS-850?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-08-29 03:54:41 UTC
From: Ed Thierbach
Topic: 8237 Message: 8237

Hi, everyone --

I recently received a TS-690S as part of an estate lot I bought. I'm thinking about keeping it as a backup, and as a future source of parts for my TS-850SAT. How many major parts (boards, power supply, etc) do the two radios have in common? Am I better off selling the working 690 and getting a "parts rig" 850 (one that has the newer DDS chips, of course)?

Thanks and 73,
-Ed- AB8OJ

If I Remember Correctly,
The 690 is basically a 450 with six meters added in place of the auto antenna tuner. It is a good rig in its own right.
I don't now that much would transfer to the 850, though they may share some circuitry.
(Others please correct me gently if I am in error....)

A lot of the individual parts are the same. At the board level there is nothing that matches.

With the 690, you could still add the internal auto tuner as an option. So even thou it has 6mtr capability the auto tuner could also be added. Most of the boards differ between the 690 vs 850

8241. TS-850SAT Display Repair $1.39 Cents

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-08-31 12:48:05 UTC
From: a_borg
Topic: 8241 Message: 8241

Okay here's an old familiar issue. My 850S serial number series # 21200xxx display went dead. To my surprise it had already been fixed before, but with this caveat. The C18 cap that leaks and eats up the trace was replaced with a 100uF 25v cap instead of the 470uF cap from the original circuit. There was also other repairs to the board. To keep this short, I replaced it with a $1.39 cent cap from Rat Shack. It still did not work. The original cap leak to the trace was cleaned before, but still no display. After pulling out the ohm meter I discovered the trace path from the positive side of C10 (470uF) cap to the transformer, even though there was no visible break was opened.

I placed a jumper wire from the (+) plus side of the cap to the transformer solder point on the circuit and I have now display ignition.
The five screws and mini flat ribbon cable to the display was a fantastic design scheme. That made the repair about 1 hour and half.

My suggestion to replace this cap now, no matter what the serial number and save the headache and possible display board leak destruction now. A dumb monkey can do it, so what's your excuse. I have ordered the other capacitors that are known problems from mouser and I'm going to change them all. Here's repair info from the web that I used.

" http://jvgavila.com/wb7.htm "

That's my 2 cents. 73's

Greetings,

I am new to this forum, and new to the TS-450! I just bought one recently, and it is my first HF radio. I really like the radio, although I have mostly been listening and have not transmitted much. I learned code to upgrade my license a few years back, but never did anything more with it until now. I am hooked! I really need a cw filter (anyone have an extra YK-88C-1 to sell?).

I have read on this forum about some common problems with these radios - I cracked open the case tonight to have a look inside and the battery and all the capacitors that I could see look good - no leaking. Aside from replacing / relocating the battery to another location, is there any other 'preventive maintenance' that I should consider? I think I will be hanging on to this radio for a long time, so I want it to last.

Thanks!

-Josh KD7PAJ

I would like some clarification on the Receiver Section Adjustment in the service manual (page 121) for some of the CH:xx references. for example Item 6, does the CH:00 reference come from the MENU selection No. 6 (ch00)? Also in Item 7, does the CH:01 stem from the previous step which selects MENU No. 3 - ch01 and vise versa? So for Item 7 - Step 2) after the Adjustment Mode Reset occurs, how does the CH:02 occur in Item 8/CH:03 in Item 10 and so on?

I find EB5AGV's site to be an invaluable resource to the ham community, it is gratifying to find an individual who appreciates classic well designed radios who has the drive to keep them alive.
This in the new reality of many hams who are "downsizing" (getting older and retiring to smaller digs) and who are trying to keep our "vintage" gear working. Yes crew the TS-850 can be called vintage, but what a world class vintage!
I have found that his site with his pictures has assisted many in that pursuit.
Jose, Keep up the good work.

> Okay here's an old familiar issue. My 850S serial number series # 21200xxx display went dead. To my surprise it had already been fixed before, but with this caveat. The C18 cap that leaks and eats up the trace was replaced with a 100uF 25v cap instead of the 470uF cap from the original circuit. There was also other repairs to the board. To keep this short, I replaced it with a $1.39 cent cap from Rat Shack. It still did not work. The original cap leak to the trace was cleaned before, but still no display. After pulling out the ohm meter I discovered the trace path from the positive side of C10 (470uF) cap to the transformer, even though there was no visible break was opened.
>

AB2ET,

Thanks for the ditto regarding the TS850S. It's a great radio, that with a little preventative maintenance can still be a great competitor. I have a colorized 3 ring binder of every mod, fix and tip on this radio.

I do beleive that when the aip is set on, then the memory is set, the aip is set with that memory.....

just checked and yes, it does save in the same memory channel as the frequency is saved....

if you dont want it to set the aip on, hit m>vfo turn off the aip and then resave with m. in

Rich, I just tried your suggestion and you are 100% correct. I brought up a freq on the VFO, AIP enabled itself. I disabled and entered. No more AIP. However, now I'm thinking I might have been wrong (twice) and you are right again. It might be the bandpass filter switching that I am hearing. Still checking.

Thanks for your patience and taking the time to explain, help us out.

Steve, N4JQQ

ve3iay wrote:
> I am a thousand miles away from my TS850, so I can't check this for sure, but my recollection is that the *default* for the AIP switches automatically below 10 MHz, but that it's only a default. If you use the AIP button to turn AIP off on a particular band, for example, then the next time you switch to that band, if I have remembered correctly the AIP will be off regardless of what the default behaviour would have been.
>
> If my recollection is correct, you would simply turn AIP off on all bands, and then switching bands would not change its state. However, it is possible that the AIP state is remembered in individual programmable memories. If this is the case, you would have to turn AIP off *before* storing a frequency in memory in order to ensure that the AIP off state was remembered in that memory.
>
> Another thought: are you certain that the relay you are hearing is associated with the AIP? If it's the front end bandpass filter switching that you are hearing, nothing you do with AIP or any other controls is going to have any effect on it.

Hi its Dave M3CAD,
Have a problem with my radio, I switched it on lit up as normal then it gave out a three bleep error code and display went out, if any of the buttons or vfo are touched the readout comes on momentarily then sends bleeps again, there is no TX/rx while its like this, if the radio is left on for hour or so it comes back to life on its own and as long as its left on it will stay working, I have tried all the plugs I can see to check if any loose , I can hear a relay clicking when I push power button but nothing happens. I had it working all yesterday after the first problems but as soon as I switched it off it it refused to switch on again, anybody got any idea's?? the radio is a TS450S

Dave

Check the lithium battery behind the front panel first, when these go low can cause strange problems other than loosing memory. Have you done a full reset as well?

Does the display go out regardless of what original frequency was programmed in, if the PLL goes out of lock this is usually what happens. On mine this was due to drift over time of the VCO on bands above 21 MHz, using the service manual I recalibrated it to bring the control voltage back to its calibration point.

My father in law's 450 acted kinda like that. No display, no receive or transmit. I took a cool it can, freon, & sprayed the 8.375 Mhz crystal in the CAR circuit & rig came alive. That was back in May & rig is still working fine today. I checked at CN3-1 with frequency meter & crystal was right on 8.375 Mhz. Guess crystal just needed to be awaken.

Did it eat through the internal traces on the PWB? Look around the area and check the schematic and PWB layout to see if there are signal traces that pass through the area. Of course I could be wrong if it is a simple 2 layer board.

Thanks,

Gene

I have a spare, just need to find it and check it out, it was new and had
the filters (standard) fitted.

8270. And another new guy!

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-09-07 21:51:50 UTC
From: ke7onz
Topic: 8270 Message: 8270

Greetings all. I'll be taking delivery of my TS-450S around the end of this week. Finally decided to take the plunge into HF. Why the 450? Budget constraints had a lot to do with it. I also happen to like the rigs from around 1990, give or take. They seem more solidly built than most of the newer units and components can be soldered and de-soldered when necessary. A guy like me who believes radio works mainly via sorcery can actually perform adjustments and make minor repairs and mods like battery replacement/relocation. For the time being, I'll be mostly in the listen and learn mode.

Better to remain silent and be thought a fool than to speak up and remove all doubt.

Bill KE7ONZ

From: kp4cat
Topic: 8272 Message: 8272

Hi group:
I just decided to upgrade to a TS-2000 and i need to clean the room. I decided to sell my ts-850, and posted here first because i want gave all of you the first change.

The radio is in excellent condition. Cosmetically is an 8.5. The radio only have those issues. First the tuner can not tune anything on 10 meters, the power output in 10 is less than 5 watts. In 20, 40 and 80 meters the radio works excellent. Power output on 20 is 80 watts and on 40 and 80 the output is 130 watts or little less. The other issue is that the display shows unreadable numbers. All lights on the display and the radio works fine.

The radio comes with power cord, user manual and a mint condition MC 80 microphone. The mic is in mint condition, came with a brand new wind screen and manual in the original box. I'm asking $375.00 plus shipping from Puerto Rico (00610). Please messages to my email ; kp4cat@.... I want to keep all communications out of the reflector.

Thanks.............

8276. For Sale: Beautiful TS-450s A/T

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-09-10 21:17:51 UTC
From: n4dfp
Topic: 8276 Message: 8276

For sale, a beautiful TS-450s A/T. This has the original 2 filters only. I no longer have the manual but I will include all manuals and other info I can find on a CD. I have have had this radio for about 3 years and have made contacts around the world using nothing more than my AB-5 spider mounted on a tower. Included will be a microphone with an 8 pin plug. It is not wired for a Kenwood, but this shouldn't be a problem for a ham ;). Also Included will be an Astron RS-35m power supply. I am getting rid of my baby only because of financial hardship. My bad luck is your good. I am located in Cassatt, SC. My Phone number is 803-425-8199. UPS Shipping to anywhere CONUS is included in the 500.00 purchase

Type: Amateur HF transceiver
Frequency range: TX: 10-160 m + WARC
RX: 0.5-30 MHz
Mode: AM/FM/SSB/CW
RF Power output: Max 100 W
Sensitivity: N/A
Selectivity: N/A
Image rejection: N/A
Voltage: 13.8 VDC
Current drain: RX: ? A
TX: Max 20 AM
Impedance: 50 ohms, SO-239
Dimensions (W*H*D): 270*96*305 mm
Weight: 7.5 Kg
Manufactured: 198x-199x

Asking: 500.00

8277. The poor man's TCXO for the TS450?

From: Crownhaven
Topic: 8278 Message: 8278

I have a ZLP CAT interface cable for the Kenwood TS-850/450/690. No instructions came with it. Web page says it is plug and play. Am I missing anything here???? I can simply connect this to my computer and control the 850/450/690 via software? Any settings in the radio's menu? I would love to hear from someone who might be using one. ZLP says direct replacement for IF-232. Sorry to be such a bone-head but the cable came with a TS-850S I bought last year. Also noticed the seller included four of the YM6631 modules which he said he bought in case the ones in the radio ever failed. Are these the parts that are no longer available???????

I also have an INRAD #104 400 Hz filter for sale as well as an INRAD #22 250 Hz filter. I would actually like to find an INRAD SSB filter to replace the 250 filter as I find the 400 Hz filters work fine for me.

Regards,

Steve, N4JQQ

Josh
It should work pretty well by running the crystal at a higher temp than it will ever get to with ambient temperature variations in the rig. The only downside is that the crystal is not optimised for the heater temperature, proper oven crystals have a turn over temperature that the heater matches. You might have to recal the oscillator after fitting the heater as the crystal will be running at the higher end of its temperature tolerance and could be quite a few ppm off.With some crystals this can change the ESR and sometimes the oscillator will not start, but with modern crystals this is very rare.
My company used to make these heaters but with low power DTCXO's these became obsolete commercially. You should achieve stability of the order of +/- 1-2ppm.

Hi Tommy,
Like Roland said, you can get your cable, and other interfaces for your radios at ZLP. They have solutions for simple rig control (like the cables), as well as interfaces for digital work (RTTY, PSK, FSK, etc.).
Also check out WestMountainRadio.com for their RIGblaster stuff. It costs a little more, but requires no special DIN cables, does rig control AND ALL digital modes, and can move with you between different radios and makers.

i have the same setup with 850's and 950's and that is all you do
plug it in and then go to the software you are using and set
to Kenwood and 4800 8 n 2 and you are good to go. what software are
you running ? n1mm dxlab hrl ?

Hi Tommy

Just go to ebay and search G4ZLP. He should have one for your radio. I have 3 of them here, 2 for Kenwood and one for Yaesu and they all work great. Six days shipping from the U.K to Oregon.

I also had a problem where one of my Kenwoods quit working. I emailed Neal and he had another cable in the mail to me before I even sent mine back. Found it was the radio not the cable. 73

Are you tired of that puny lightweight main tuning knob on your TS850S behold the "HULK" knob. It adds that need age radio look on most of the newer generation radios, more weight and very smooth turning. Sorry for the crappy Blackberry pictures, but new ones are coming. You can have thi baby for $25.00 shipped in the CONUS. Just send your knob, signed receipt and I'll ship back this beauty to you.

Hi Gary,

Good call, the 'Finger Dimples' come in sets of 2. They are either available in black or the characteristic dark grey that Kenwood uses. Just make sure that you clean the spot on the knob face where you are going to apply the dimple. I used alcohol and my dimple has endured daily workouts for about three years now without falling off. Very solid feel and a great product at a great price. Have fun.

8303. Need help with display dots pll unlock error on TS450sat

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-09-14 03:24:36 UTC
From: JP
Topic: 8303 Message: 8303

I have been searching the forums with little success (see bottom). I am asking for help from the brain trust :-D

Here are the numbers from my voltage testing. I assume that TP1/2 is the lonely pin sticking up that you test with, if not, then ignore my numbers and kindly tell me where to stick it... the probe that is.

30k, tp1, .5~.8v
7.499, tp1, .75v
7.5, tp1, .75~.78v
14.499, tp1, .6v
14.5, tp1, .6v
21.499, tp1, .55v
21.5, tp1, .55v
30, tp1, .56v
30, tp2, 3.95v

I am using a digital voltmeter and I tried these measurements in autorange and fixed just to be certain. I let the radio warm up for half an hour or so, then took the cover off and fired it up and did the tests during this time period. All the while, it is hooked to a 12v, 22ah AGM battery with a steady 12.5v, I also tried with a 7ah battery that was also fully charged just to be sure.

The radio seemed to stay unlocked for a while in one of those frequencies but I didn't notice which since I had the speaker disconnected and didn't hear it come on. The PLL error is on all bands. It started once a few months ago and I thought it was just a low battery, because the next day it was gone. It now comes and goes, but mostly stays.

I have the adjustement section page (thanks for posting that!), and I used it as a worksheet. I don't have an o'scope or really know how to use one. The only freq. counter I have is in an MFJ antenna analyzer.

I am not sure which VCO is the culprit, as I see suggestions elsewhere that seem to mix TS-440 and TS-450 and I am not sure if there is a difference on the 850 and 690. I am willing to twist some pots, but don't want to mess with the wrong ones. So, if you say I need to check one, please give me a reference on the radio that puts me in the right place.

I am pretty handy with a soldering iron. I managed to relocate the AF pot to the side of the case by the speaker when the original broke (I would LOVE to get a replacement original AF/RF pot, email me if you have one please). I also built a couple of altoids tin PSK adapters on protoboard. I am not so good at reading electrical diagrams and schematics... actually, more to the effect as dead stupid at reading them.

Thanks in advance for your help. From the replies I see from other questions I am confident I will be on the air again in no time!

KA0NEM, Jess Perry

Here is why I had no success searching the forums. I *have *been searching the forums, but there must be some corruption in the search or database that is mixing message numbers. For instance, message id 7208 and 7209 show up as related but on clicking the result or jumping to that message number it is a totally unrelated topic and different than the search result. Below is an example.

search result:
7208 TS450S display
dots<http://groups.yahoo.com/group/TS-850_450_690/message/7208>

Hi all! *PLL* unlock problem issue again. First time, just remove all connections between VCO and *PLL* board, then after 2-3 months, back again. When power on radio, U/L message in CW, and then dots on display. After few minutes (five or more), display ...

Hi Jess. I don't know if this will fix your problem or not, but I worked on a 450 that had no display, but gave a error which I don't remember what it was. Anyway I sprayed freon, cool it in can, on the 8.375 Mhz crystal on the CAR board & rig came alive. That was back in May & rig is still working fine.

I, for one, think the 850 knob looks and works great as designed and has no need for dimples or gamma rays.

What radio are you working on? The header says 450 and you give the test points for the 440.

I got the pll section alignment from the files section,
Files<http://groups.yahoo.com/group/TS-850_450_690/files/> >
ALIGNMENT FAQsThe two jpg's there seem to have the same info as the
VCO_Adjustment.pdf<http://f1.grp.yahoofs.com/v1/cFquSgm6fmML8ndgZv_uwqjDWgR4mIaMs5TXqGUJHg
7jQTatJJKcDTai5RFFhtDzavOVq1nWf6_5I3piauuxvteTqaGGngcg350/Manuals%20and%20Schematics/VCO_A
djustment.pdf>
from
Files <http://groups.yahoo.com/group/TS-850_450_690/files/> > Manuals and
Schematics

If I have the wrong rig, that could definitely have something to do with it.
I only have an owners manual, I don't have a service manual. I will download
one today and see if the measure points match the 850. Thanks for shedding
light on that Cliff!

It seems, from what I have read, that a unlock issue accross all bands is
usually related to a single pll unlocked, a common one. I can't seem to
decipher which trimmer to adjust to see if that is the issue.

w4jz, it happens either after sitting cold, or after warming up for half an
hour or so with about a 10-15min window where it works.

Thanks,

KA0NEM
Jess Perry

Topic: 8303 Message: 8312

Well, I think I fixed it. The adjustment chart in the files section is definitely NOT for a 450. I found TP3 (didn't know there was a TP3 till I found the full manual) right next to the appropriate VCO box. I broke the trimmer loose and made a minute adjustment CCW to bring it up to 5v, in fact as soon as I broke it loose the display came back on.

I will recheck the other VCO's tomorrow, but I should be able to button it back up (after checking for leaky caps and battery).

I will post the correct chart to the files section if that is OK. I sure wish the old messages worked, I bet I would have saved myself some time and the rest of you the pestering.

For posterity, in case any others have this same issue, let me save you some time...

TP3 @ any freq should be 5v. The alignment chart was found on page 120 of the Kenwood Service manual for 450/690 that I download... your mileage may vary. The correct trimmer TC1 is under the VCO2, the can with the three screws and the small coil in it, there is only one, and the TC1 trimmer is beneath the hole in the can (SE corner). It is DIRECTLY under the speaker under the VCO cover. TP3 is directly East of this can, and close enough that I didn't even see it the first couple times pulling the cover off.

If the pll unlock error is present on all bands, it is most likely this VCO out of adjustment. I found on another forum that the trimmer itself can oxidize or corrode and just breaking it loose without adjusting it one way or another is sufficient. The voltage comes up very quickly, so keep a steady hand. Also, the trimmer has a phillips head with a pin in the center, so you can't use a phillips screw driver, however, a flathead about the size of the head works just fine.

Hope you don't have to read this... but if you do I wish you well and 73!

You can also find their cables on ebay, there is someone in the US that imports them and resells them. They cost a bit more, but you get them much quicker.

I got one, very good finished product, the circuit is contained in the connector and has no more bulk than any other serial cable. Good product... works great for digital modes as mentioned, I love sitting on the couch in the living room and tuning around the bands spotting PSK and carrying on the occaisional QSO from the laptop when my rig is 100' away.

8315. Need a replacement AF/RF gain dual pot for a TS-450S

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-09-15 05:48:30 UTC
From: ka0nem
Topic: 8315 Message: 8315

I need to replace a broken volume knob, my TS-450 got the AF gain knob knocked, it pushed the back out of the pot. I have relocated the volume to another location on the case, with a 10k/audio taper pot, but it is not quite the same. The outer RF gain pot is undamaged. I couple probably rebuild the AF pot if I canabalized another if, for instance, the RF pot was damaged.

I am ok with new or used, or a comparable replacement. I have turned up no parts with various popular parts houses, and some local repair shops and old-timer's shacks.

Feel free to email me ka0nem at w2bn dot org.

Thanks.

My dog is getting silver whiskers... want me to replace him too? Hi hi. The first time I saw those whiskers was on a slashdot article many years ago and I thought it was the most fascinating thing... the mystery (at the time) on how they grew was pretty cool.

Looks like Kenwood parts is dropping most of the 450/850 parts. Not many left that aren't discontinued.

Yes, of course I checked with Kenwood parts. They are discontinued, I have also checked a dozen other parts houses and they all tell me the same thing, kenwood part that is not in stock and not available.
I also tried several places like Mouser for dual pots of similar size and shape and can only find modular units I have to buy in gross.

Thanks.

Been into old cars and Harleys for years. Now it's old radios. All have the same thing in common. OEM replacement parts are nice but get scarse and finally disappear altogether. Best thing is tech special parts buckets cheap from ebay and anywhere else you can find 'em sometimes yours for hauling off. When those are gone, find other make parts that spec out the same electrically and get creative. No, they're not OEM but I've seen and done many after market instalations that looked as good as they worked and sometimes better on both counts than OEM.

Runnin' 'em beats lookin' at 'em on every day that ends in "Y".

Hey guys

Yesterday afternoon I was on my TS-850 and all was fine. I went back into the shack after dinner and my power output on all bands had dropped to 50 watts (SWR 1:1) and any QSO I tried to make said my audio was distorted. I plugged in a set of headphones and turned on the monitor and sure enough, distored audio as well. Anyone have any clues as to what might be causing this?. I change the coax and went to a different antenna as well with same results

Sounds like it could be either a DC/DC converter or a DDS chip failure. You can still get the DC/DC converter but the DDS is no longer available hopfuly Clif will chime up as I am just guessing and He would know more.

Hi...first we suggest you check the transmitter into a dummy load and a good calibrated RF wattmeter. (antenna tuner , if installed, OUT).(MODE: CW) ?If the RF power is then okay, check RF Power with the AT in circuit and ensure the AT unit tunes properly.

If the power is okay with the AT "out" but not "in", then your radio has AT tuning issues.

If the output power is still not correct,? next thing is to check the PA output transistors for proper IDLE current. Consult the service manual for the technique and measurement points.

Thank You

Kiss-Electronics

Good analogy, I just wish that the specific part on this radio I need was
not so uniquely constructed and manufactured out of Unobtainium.

I just tried it again this afternoon and it is working again. I left the Power supply on all morning to make sure it was good and warm. This morning it was onlu putting out 12 volts. This afternoon is was putting out 13.6. There are no meters on the PS so I can't tell if the amps are low..

Curious,

  I got a lot of smart responses about the HULK Knob and you can't get any responses.

Try this.
Sudden dropoff in transmitted power, and a terrible
burning smell coming out of the fan vent whenever the radio is in transmit. When
the top cover is removed, the smell seems to be coming from the left front side
of the radio. The following failure
occurred on both of my TS-850's within a six month period.

Problem: The problem is that C1 on the Carrier Unit, X50-3140-00, has failed.
This board is the second board down in the 3-stack of boards on the left top
side of the radio.

Topic: 8315 Message: 8329

Thanks Mike. I thought about that, but no burnt smell, and I had C1 replaced last year. My power supply is really old and that is what I am suspecting. When i turn on my 2m rig, it tells me what the voltage is and that is when I saw the 12 volts instead of 13.8 like it should be

Curious,

  I got a lot of smart responses about the HULK Knob and you can't get any responses.

Try this.
Sudden dropoff in transmitted power, and a terrible
burning smell coming out of the fan vent whenever the radio is in transmit. When
the top cover is removed, the smell seems to be coming from the left front side
of the radio. The following failure
occurred on both of my TS-850's within a six month period.

Problem: The problem is that C1 on the Carrier Unit, X50-3140-00, has failed.
This board is the second board down in the 3-stack of boards on the left top
side of the radio.

Hey guys,

I have not heard back form anyone on this yet. Do you think that if

the power supply is going bad could cause these symptoms?

I forgot to mention that my 450 was serviced by HamRepair.com in Dallas last June before I bought it. One of the items listed was "Rebuilt AF/RF VR", so all may not be lost. I don't know if Cal would want to rebuild a single pot or not but we know it can be done.

I had similar problem a couple years ago with my 850. Don't remember if power dropped with the distortion. Here was Clif's advice.

Check the bias on the finals and drivers. The base voltages should be .6-.7v in Tx. Measure in SSB with no mike hooked up. Zero volts indicates a bias circuit problem while a higher voltage is usually a leaky driver or final.

Clif

Made some measurements on the final board and the final bias at VR2 was way low. Problem turned out to be a bad Q7 on the final board. Replaced it and got my great signal reports back again.

Hope this helps

Hello Mike,

If it were me experiencing that half power issue, I would make absolutely certain that my DC power supply could always supply at 13.8 volts DC. If you choke the amount of DC voltage getting to your rig, it will behave erratically and show you very quickly that it doesn't like sagging supply voltages. Receive doesn't require as tight a supply to function relatively normally. Fix or substitute the power supply first before you get led down the yellow brick road. My bet is that the rig is OK.

73 & GL,
Jack

I agree with Jack. Try another power supply before touching the radio. Here's a funny little story...

A few years ago my 850 developed a problem where it would not power up. After doing all the routine checks, fuses, switches, connections, etc, I had come to the conclusion there was a short in the final amplifier section. Rather than fix it, I decided to sell it as I had another radio here. A friend asked me if I checked the power supply. I did and it was measuring about 13.5V with no load. As soon as I hooked the supply to the radio the voltage would drop to zero. On a whim, I hooked the 850 up to my car battery and the radio powered up just fine. Turned out to be a bad power supply. Replaced the supply and the radio worked just fine until I sold it. Sometimes we tend to overlook the obvious.

8341. TS-450 Won't Key

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-09-22 18:12:56 UTC
From: k7zs
Topic: 8341 Message: 8341

Hello, I am new to the TS-450 group, but no stranger to Kenwood. Mostly older hybrid's, I must confess.

A friend brought a TS-450S for me to evaluate. It will not go into transmit. When you turn option 19 to ON after a CPU Reset, you get receive audio UNTIL you power cycle it. Pressing CLR and returning to normal use does NOT mute the receiver.

I have measured the voltages on the TRX board, and the 7.5v appears on RXB and pin 7, there is no TXB voltage. When keying the transmitter in any normal way (mic PTT, front panel SEND or CW KEY with VOX on) I do NOT get the 3.2v on pin 2 of the TRX board. So, it is never getting that voltage to the TRX board.

Where should I look? I have yet to download the service manual (I didn't see one here) and the block diagram in the manual does not show the keying circuit, nor can I find it in the schematic there.

What a great resource these groups are. Hope somebody can steer me in the direction to make a Ham without his loved TS-450S happy again!

73 Kevin K7ZS

Hello to all, First let me start by saying I am new to the group. My name is Russ and my call sign is K8QF. I just purchased a Kenwood TS450S and I am trying to decide on what microphone to use. I have a heil classic with the HCL 4&5 elements in it. Does any body use the Heil mics with this radio and if so how do they work. Or should I go with a Kenwood mic. Any suggestions would be greatly appreciated. Russ K8QF.

Option 19 is Tx Inhibit. When you turn it on the radio will not Tx.

Do a reset and make sure it is off and then try again.

Clif

8344. Mic. processor intermittent TS-850S

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-09-23 15:52:22 UTC
From: kdrosenlund
Topic: 8344 Message: 8344

Hi all,

Has anyone run into a problem on the TS-850S where the mic. processor only turns on some of the time? Many times when I turn it on, it won't work, and the modulation is even lower than it is with it turned off.

I looked inside, pushed in the cable a little, and looked at the processor board, and everything looked OK. I put the radio back together, and it worked for a while. Now it doesn't.

Any ideas? It takes a bit to get to the processor switch to lube it, and repeated pressing won't do it. There are some switching diodes in that circuit, maybe it's one of them or the ribbon connector to the switch?

Thanks,
Kit
KG6PHS

Topic: 8341 Message: 8345

Hi Cliff

I wondered why it was OFF by default, and now I see it is INHIBIT. I wonder why the receiver MUTES when option 19 is ON?

I have done it both ways, and the radio simply won't key, not even a TX indicator light or anything.

I did download the service manual, so I now see the various boards involved in keying.

I have ruled out the TRX board as pin 2 is not seeing the 3.2v on transmit. So, the problem is 'upstream'. It does not key via any method, CW KEY, STANDBY SWITCH or Microphone PTT, so I have to follow the circuit to a common junction

I am now going to trace backwards from the TRX board - BK IN board and DELAY board are my next boards to check, then VOX.

Any other suspect areas to check?

Thanks for sharing your knowledge with us Kenwood fans!

73 Kevin K7ZS

avvidclif wrote:
Option 19 is Tx Inhibit. When you turn it on the radio will not Tx.

Do a reset and make sure it is off and then try again.

Start by measuring the PTT voltage on Pin 2 of the mic jack. If it's low then figure out why.

Subject: [TS-850_450_690] Kenwood TS450S- Microphone!

Hello to all, First let me start by saying I am new to the group. My name is Russ and my call sign is K8QF. I just purchased a Kenwood TS450S and I am trying to decide on what microphone to use. I have a heil classic with the HCL 4&5 elements in it. Does any body use the Heil mics with this radio and if so how do they work. Or should I go with a Kenwood mic. Any suggestions would be greatly appreciated. Russ K8QF.

Hi all,
I am currently teaching myself CW (cannot find a mentor), been using a straight key with no problems but have now purchased a lambic key and attempted to wire for my rig.
The key in question is a CT Ham Lambic Lever Paddle, I'm using a 3core curly chord to wire key with but no matter which configuration i use i cannot get the key to work.
Can someone please help me with a description of how i wire this key to a 6mm stereo plug and then to base of key....should i be wiring to the 2 front pillars or the 2 rear pillars of key.
Please explain in laymans terms as my tech knowledge is extremely limited (i can solder a PL and can wire an electrical plug but thats it).
Thankyou

Adrian

if its like the 850, I seem to remember a toggle switch on the rear of the radio, not sure if the 450 has it, but it had to set to electronic.

there may also be menu toggle

check the manual

Adrian...If you are trying to hook up the paddles directly to the key jack, it will not work. The 450 does not have a built in keyer. You will need to get an external electronic keyer. Then follow the instructions in the manual for the plug hookups.

Gordon, kc2bw

Topic: 8341 Message: 8351

Hi Clif

I guess I was looking from the wrong end!

I had no voltage on pin 2, so followed the wires away from the mic jack - there are 2 groups of wires that come away from it, so removing and replacing those wires at the 2 different places they go solved the problem. Actually, it was the pair of yellow wires that, after removing and replacing from the connector on the board nearest the front of the radio and VOILA! It transmits again.

As always, a BIG thanks to Clif for sharing his extensive knowledge of these radios - the owner of this TS-450S is ECSTATIC that it's repaired.

Hi Adrian

First off, congratulations on learning the code.

I guess you do know that you can't hook the paddle directly to the radio. The TS-450 doesn't have a built0in keyer. You have to use a keyer of some sort.

On the cord, the tip goes to one side, (either dit or dah, depending on the keyer), and the ground goes to the base of the key. You need a 3-wire cord to hook to the paddle and keyer. 73

Oops, what I meant to write was the tip goes to dit or dah, the ring goes to the other connection and the ground goes to the base of the paddle. Thats why you need a 3-wire cord. Sorry for any confusion. 73

My 450 doesn't have a keyer (don't remember seeing that as an option). I think you might need a keyer, as the key in the TS-450 is just an open/close affair. Some paddles have a built-in keyer, I have an MFJ that does. You could still use the paddle key with the rig (might need an adapter or change in the plug), but it will not be automatic dits and dahs.

Thankyou to everyone that replied to my question.
I was unaware that an electronic keyer was needed to use the paddles...i was trying to wire them directly to the jack plug on rear of my rig.
Forgive my ignorance..i'm knew to the world of CW and have only used a straight key, ok so i need to purchase an electronic keyer to get my paddles working.....does it have to be a particular keyer or can anyone reccomend 1.

Thanks all for the replies

Hi Russ, I use Heil mics as well. I use the Goldline GM5. I used the narros element for dxing. I have found the wide element works really good with the high-boost on with the TS850 for 40m ragchewing. Not sure if the 450 has the high boost feature. If it does not, you might be best with the HM-10 that has both the HC-5 and the HC-4 elements.

Didnt take long for people trying to cash in on the obselete YM66312.

http://cgi.ebay.com/NEW-4ea-YM66312-DDS-Chips-for-Kenwood-TS-850-TS-450_W0QQitemZ190333193170QQihZ009QQcategoryZ4674QQcmdZViewItemQQ_trksidZp3286.m7QQ_trkparmsZalgo%3DLVI%26itu%3DUCI%26otn%3D1%26ps%3D6

have a look at this link on ebay.

8361. TS-690S Filters -Kenwood SP-31

From: k8yzk
Topic: 8361 Message: 8361

Hello to All. I traded for a TS-690S and it came with the SSB in the 8.83 slot. Is there a easy way to switch the filter in/out of the receive. I know there is the thru selection but I am trying something out.

Also looking for 8.83 cw filter and a good used SP-31, if anyone has one for sale.

Thanks and 73
Kurt

I have four YM6631s in the Kenwood boxes, yellow label, looks like a Kenwood receipt showing shipment to US on 8/3/03. Purchased from East Coast Parts on 4/8/08 @ $28.00 each. I have not sure if either of my two TS-850s have the upgraded chips or have ever had theirs replaced. I'm glad I have these.

HiKurt

Push the 8.83 button. That switches the filter and out. It should step
through THRU, 6K, and 2.4. 73

I REALLY need the AF/RF pot, the whole board would be great, but mainly the
dual pot.
email me at ka0nem at w2bn dot org

Thanks,

Jess

Hello all,

Is there anyone in the Northern Illinois/Southern Wisconsin area that works on TS-850's? I've used Aavid in the past and am very satisfied (thanks Clif)!

I have an 850 and I have one or two friends with 850s and we all want to get the Carrier Board caps replaced, battery replaced and the external receive antenna mod done.

We're all the other side of 40 and the eyesight isn't what it used to be so working on SM populated PCBAs is not looking too attractive. What we were hoping is to avoid the shipping and loss of radios and find someone locally to do this.

Anyone out there??

73,
Gary

Hi

I have had a TS-850 for some 12 years now.
Has there been any real worthwhile mods over the years.

Front end upgrades or the like.

Just interested

de Johnny G3LIV

Aloha Johnny,

Yes the Inrad Roofing filter is the best front end mod out there it brings the 850 up to more modern radio specs as far as close in rejection of strong signals. It is worth the money and then some I highly recomend it to anyone who wants to work weak signals on a crowded band. I have worked stations just above the noise floor 3-4 khz from a S9+ signals. With the Great receiver in the 850 the roofing filter makes it a Real World Class radio. I wish I had a DSP-100 with that it would kick some of the $4000 dollar radios butt it comes close with out the DSP-100. If any of you guy's reading have not installed the Roofing filter yet do so ASAP you'll be glad you did.

There's a note on Inrad's website that they researched making a roofing filter for the 450/690, but due to "physical/mechanical considerations" it wouldn't be practical to produce. However, they do offer a couple of "experimental" items if you want to try it yourself.

Roland, does the mod affect the current filtering of the radio? Is the receiver narrower on SSB for example with the 2.7 K filters both enabled????? I'm talking about differences in audio if this is making any sense.

Thanks for your patience.

Topic: 8383 Message: 8390

Hi all,

There has been some lab tests made by DL6RAI/DK4YJ on a modified TS850 + INRAD roofing filter.

The global sensitivity is reduced by 3dB due to the higher insertion loss.
The IP3 is improved by 2.5dB for signals spacing outside the original filter bandwith (20 kHz) and about 8-9dB for closer spacing <10 kHz.

In practice, they could not notice any big improvements even on a crowded band... A blind test has been made with 2 other ops with same result.

On the other hand, the -3dB in sensitivity was very noticeable, especialy on the higher bands.

Original page (in german) :
http://www.bavarian-contest-club.de/reviews/Erste-Eindruecke-vom-INRAD-Roofing-Filter-fuer-den-TS-850;art32,1100

Just my 2 cents,
73, Patrick

Folks,

I have compared a tricked out TS850 to my Elecraft K3 and not using test equipment but on the air tests show a TS850 with good filters in both the 8 MHz and the 455 KHz IF is close to my K3 on SSB but on cw, the K3 is better for separating weak signals. On 160m where my TS2000 just shakes with overload, the TS850 just works. However, when you consider a good TS850 with filers is 1/3 to 1/4 the cost of a K3, one has to wonder. Except for the diehard contesters, I still don't think you can't beat a TS850 with good filters. As far as the roofing filter mod goes, one of my 8 TS850's has it and I wouldn't bother with it, I see VERY little improvement on the air and do notice the gain drop. Yes, the "numbers" are better but most of us don't listen to numbers.

Just my .02 worth!!

Terry

Hi Guys,

How nice to have such a good response to my question.
It shows there are still a lot of US out there that think the
TS-850 is still worth a place on the desk.

I have not been able to put it alongside other major more modern rigs.
A 706Mk2 and an FT-857 dont make my heart race Lol.

I do have 3 filters installed, purchased over the years when I have seen them sold off pre-used.

YK-88SN-1 YK-88C1 and the latest one YG455-1/CN1.

That last one is still very expensive new in the UK but I bought it
used for £40 thats about US$60 so I jumped at it.

I had wondered if over the years there had been any advance in any front end semiconductors that had made any worth while changes.
But it sees not.
I keep promising to change that battery.
This interest has prompted me to do it this week.

Licensed 53 years still have the bug.

see www.g3liv.co.uk

Thanks guys

de Johnny G3LIV

Topic: 8383 Message: 8394

It does not affect the SSB Filtering it does affect the AM somewhat and it does affect the FM since it is only a 6kHz wide roofing filter.
It will not make the Receiver any more narrow in the SSB mode unless you have say 2.1 (like I do in both IF's) or 1.8 filters.
Hope that helps Steve.
73,
Roland AH6RR

Aloha ED,
It only narrows the received audio some it is still fine but the BBC wont be super brodcast quality anymore it will sound good but not excellent.
Oh and reading the other posts on how it degrades the receiver by 3db Did you guys install it correctly? For example yesterday FT5GA was on 20 my SteppIR 3 element is at 35ft a friend has a K3 and the same antenna at 60ft the FT5 was uncopyable at his place only 10 miles apart and a S1-2 here and another ham with a 756 Pro III and a 4 element SteppIR at 70ft anf FT5 was just a wisper. Now both of the radios are exellent receivers but the 850 beats them. My 850 is in the 5Mil range so maybe that also makes a differance.

I know it's been talked about here many times but you MUST change the electrolytic caps not only on the CAR board but on the front panel boards also. If they leak, it could be the end to a very good rig!!!!

Subject: [TS-850_450_690] Re: TS-850SAT Mods

Hi Guys,

How nice to have such a good response to my question.

It shows there are still a lot of US out there that think the

TS-850 is still worth a place on the desk.

I have not been able to put it alongside other major more modern rigs.

A 706Mk2 and an FT-857 dont make my heart race Lol.

I do have 3 filters installed, purchased over the years when I have seen them sold off pre-used.

YK-88SN-1 YK-88C1 and the latest one YG455-1/CN1.

That last one is still very expensive new in the UK but I bought it

used for £40 thats about US$60 so I jumped at it.

I had wondered if over the years there had been any advance in any front end semiconductors that had made any worth while changes.

But it sees not.

I keep promising to change that battery.

This interest has prompted me to do it this week.

Licensed 53 years still have the bug.

see www.g3liv.co.uk

Thanks guys

I'm sure that if you swap your transceiver between you and your friends, you will have the same results...
The antenna and QTH makes the difference not the roofing filter !

73, Patrick (and my good old TS850)

Date: 2009-10-01 16:22:37 UTC
From: Roger Dixon
Topic: 8401 Message: 8401

After 20+ years with only a fan failure, the display has failed. As far as I can tell the radio is still working OK. Before I dig the circuits and start dis-assembly, is this a known failure with a known solution?

C18 on the display board needs to be replaced also check all the traces on both sides of the board because when C18 leaks it eats them.

Hi Terry,

Well I got the 10mfd and the 47mfd changed on the carrier board today.
I could only get 8 of the 10mfd locally. So 2 still to replace.
2 of the existing ones on the board had there Ground side leg
lifted and not soldered down.
2 other showed some discolouration around them.
But after repair (they are little pads)
all is working.
I need to look into that battery mod now.

Thanks

8404. DDS caps replacement

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-10-01 19:02:07 UTC
From: tk5ep
Topic: 8404 Message: 8404

Hi All,

I checked my TS850 several times for capacitor leakage and could never detect something wrong until this evening.
I found my DDS board to be a bit "greasy" around some caps.

So, i think it's time to replace them.

My question, the original caps are Low Impedance SMD Aluminum Electrolytic Capacitors. I have a bunch of SMD tantalum capacitors of same value.

Is there any problem to change the capacitor type ?

73, Patrick

Hi Patrick,

sometimes you cant see the caps leaking so it may look as if they are ok, a thing i have noticed with leaky cap is, if you put your soldering iron to the pads of the suspected caps and let the solder run you get a sort of CATS PISS smell (excuse the french)and this tells you that the cap is leaking, some people might say different but ive always used this way of detecting leaky caps.

8408. Audio Problems with TS-450

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-10-01 23:57:28 UTC
From: wd0hbu
Topic: 8408 Message: 8408

The problem I'm having is this. I am running mobile with this unit. While going down the road the audio will cut in and out. Most times if I just tap the send button, once or twice, the audio will be normal. Until the next bump or road vibration. The interesting part is next. When I'm not motion, with the motor either on or off, the same thing will happen.

What I have done is the following; I have opened up the radio and gone through it with a screwdriver and wrench and have tried to tighten anything and ever thing that might be lose. With little or no luck at all.

The question is. Has anyone ever had the same problem and if so did you if a answer. I know it could be a great host of things, but any ides as to where to starting looking again would be of great help.

Thanks for every ones time. Jim

I guess you are using internal speaker so will assume you are & not losing the display just receive. I would check the transmit/receive relay. Tapping this with plastic handle of screw driver sometimes will let you know if the contacts are dirty.

Do you have any noise on receive when this happens or are you just losing signal?

Hi Jim,

Is it the audio or the signal cutting out? As Roland suggested, check the wire coming from the antenna connector to the RF board. The solder on these will sometimes let go. If it is the audio itself cutting out, are you using an external speaker, or is it the internal one cutting out. If external, try wiggling the speaker cable and see if it cuts in and out. You may need to touch up the solder connections on the AF/RF board where the external speaker jack is soldered. These will get intermittent if the cable is not pulled straight out as it pulls the jack to one side putting stress on the solder connections.

Let us know what you find.

Max

I just joined the group because I'm seriously considering buying a TS-850 to use as my main rig after 20 years away from ham radio. I've done a search here and looked at the 850 owners manual for info about how the 850 interfaces with a computer and what kind of data can be transferred/shared between the rig and a computer.

My main interests are contesting and DXing, so automatic logging/contesting software and interactive DX spotting (with the DX Spider) would be helpful. Although I'm somewhat computer literate, I don't have a clue what kind of interactivity is possible with a TS-850 and a computer. Any info would be greatly appreciated.

Thanks.

If you downloaded the manual, also download the othe rmanuals as well. I am using the 850 here with the KeNWOOD if232c interface box, but aftermarket ones are available too.

The control you get will depend on the software you download...

There are 2 types of connections you can make between the radio and computer:

1 - control the radio's functions, like changing frequency, changing bands, and turning functions on and off. You can use the Kenwood IF-232C, or other aftermarket cables.

2 - send audio to the radio, and receive audio from it. This allows you to use the newer "sound card" digital modes such as PSK-31, as well as old favorites like RTTY and SSTV. You can also decode Morse code, RTTY, fax, packet, SSTV, and other signals. You can build a simple interface, or purchase one like a RigBlaster or Signalink.

Hi all,
I had a problem a few months back with my auto tuner churning
away for a while and then giving the usual beep beep telling me it hasn`t
succeeded, even though the antenna connected was quite close to resonance.
After some internal and futile investigation by me, I decided to send it
off for repair, but someone suggested it could be one of the 850`s settings,
I tried that and it resolved the problem. It has started doing the same
again and I can`t think for the life of of what it was that fixed it. It
might be that there is a fault this time, but if anyone has any suggestions,
they would be very much appreciated.

Many thanks, Johnny, GM7LSI.

From: n0sya
Topic: 8420 Message: 8420

New to the group and the 850, just got it yesterday and joined your august group the day before that. Picked up a nice clean one, 70 million sn, checked for leaks in the car board and everything is tidy. Chased some dust bunnies out. Tried it out on the bands and am suitably impressed, audio is outstanding. I have used the following rigs to date: IC-765, IC-751, IC-746pro, IC-703, IC-735, Drake R8, JRC-NRD 505/525/535/545, TS-870, TS-440, TS-430, and various others. I am after rx performance and audio quality, and hope the 850 will reward me in this regard.

So since this is _the_ place to come for info on the 850, I have some questions re the 850:

1. If I have a high serial number rig, do the caps and battery still warrant replcaement? What are the places to check for bad caps?

2. Is'nt there a mod to have the autotuner inline on rx? Can't find it anywhere!

3. When I turn the vfo on the 850, there's hash that stops when I stop tuning. Anyone know what that means?

4. I anticipate modding the filter schemes in the 850. A crystal 2.4kHz replacing the ceramic 455kHz IF filter, a possible replacement for the cfw455ht am-bandwidth filter with something better, and matching-bw cw filters in each IF. I found a MuRata metal cased 455kHz ceramic filter that has 11 poles at 6kHz wide in my junk box, god bless junk boxes! This should do well against the 6 poles of the cfw455ht. I also have an Icom FL-44A 2.4kHz crystal filter that I intend on remotely mounting with rg74. Anyone swapped filters other than standard Kenwood parts?

I would like to add one of the Kenwood 8.8MHz IF 6kHz bw filters, think it's the yk88a. If I have to buy a 850 cw filter just to get the mounting board and replace the actual filters, fine with me. Anyone done mods like this? Anyone know where one can get bare filter boards? Anyone know where I can pick up a yk88a?

5. The audio out of the see-if-it-works-speaker on the top of the box blew me away. Never heard one sound so good. But connecting a hifi speaker to the ext spkr jack in back resulted in very poor audio, tinny, no depth or bass. Anyone know why the audio is so poor here and how to fix it?

Any thoughts for an 850 noob appreciated.

Chris

Re the higher noise floor, I think this is due to the higher gain of the 850 rx compared to many other rigs. Not a pll/dds issue, but one of greater sensitivity.

Sorry for the late post but I just got here!

Jack

Take a look at some software called HamRadio Delux.

http://www.ham-radio-deluxe.com

This will give you an excelent insight to what you can do.

HRD is free also, which is a bonus as the software is excellent!

Plenty of information on this site about connecting up the computer.

As Already said two different typs:-

1 rig control
Let the computer control the radio, or the radio control the computer.
DX Cluster, memory management, band markers, auto-logging of mode and frequency, mapper, rotator control, keyer etc etc

2 Sound card connection
Lets you use the computer to decode and transmit digimodes (PSK RTTY MCW SSTV etc) using DM780 (included in HRD). Also sound recording, and possibly in future voice keyer!

Check out the user forums for a wealth of information.

Plenty of other free software available (everyone has their own preference), especially if you want to specialise in contest operating (voice or Digi), but HRD pretty well does everything in one package. Can look a little overwhelming at first, but easy to get to grips with and a large user community to help.

By the way the TS850 is one of the better radios for digimodes, as not every radio allows you to switch in any filter on any mode like the TS-850

Regards

peter

Hello everyone, I have a TS-450s and just recently I tuned the rig down to the very lower limits and the tuning knob "froze up" on me. It was working just great before that so I don't know if it has anything to do with me tuning the radio to the lower limits. So far, I removed the knob and attemped to move the post by hand and it's really tough to move. I am not a radio repair man by no means. Please advise if you have had any experiences with this and what you did about it.

Thank you

Joe, N9RYM

The main knob is an optical rotary encoder (AFAIK). I don't think there is a limit in either direction, if it were, then the knob would spin when you change the frequency from the keypad... which would be awesome btw.
I have freed up a rotary encoder with electrical parts cleaner in the rotary assembly, one was full of coffee from a previous owner, took some wd-40 and then followed up with the parts cleaner, it was stuck but good. But I would wait to see what the others in the group say. I just wanted to reply to you real quick to hopefully relieve you that it should (hopefully) be a simple fix. Worst case, I see main encoders on ebay just about every time I look for TS-450 parts/accessories.

Good luck, and hang tight, the experts are on their way.

Thanks Peter (and everyone else who posted a reply to my question). Sounds like the 850 is quite adaptable to computer control and other functions. Overall, it seems like it will do what I want computer-wise.

On a slightly different topic, Monday I just missed out on getting a mint 850 at a great price from an online dealer who I've bought gear from for a number of years. Very disappointing. Oh, well -- C'est la vie!

Hi,

Perhaps you want to trace inside on the Filter Unit part, especially the link from the VSWR circuitry (L121) up to the connectors. This should include the AT trace back.

Start checking the traces and TR switches first, then check the active components.

This is presuming that you have the service manual and have some servicing background.

Thanks and good luck

Subject: [TS-850_450_690] Kenwood TS-450 no power out, maxed out SWR indication

Here is my problem. I recently purchased a TS-450S and Kenwood power supply, used. I am at least the third owner. The previous owner was visually impaired and had problems with antenna tuners. I suspect he often operated into high SWR loads.

My first extensive use of the rig was this past weekend during the California QSO Party where I operated 16 hours on CW and SSB running pretty much max power (100 watts output). I had extremely low SWR values and no problems with the rig.

On Monday morning, I fired up on 40 CW to work some DX. I did an SWR check and had a 1.5:1 value before kicking in the tuner which brought the value down to 1.1. At no time was the rig operating into a high SWR or shorted load.

All meter indications were nominal. I made several quick calls to a BA7 without response and then noticed that the TS-450 SWR ribbon was maxed to the right. I immediately checked the external tuner (an LDG AT-11) and found that there was no output.

I dialed the power back to about five watts and began trouble shooting antenna connections. Antennas and jumpers seemed OK and I hooked up a 50 ohm dummy load. The SWR ribbon bar was still maxed to the right with no indication of power output (at the five watt level). Reception was normal, with the BA7 coming in at about 579.
To me, it would seem that if there was no PA output, then there should be no SWR indication either. And, with the dummy load, there should not be an SWR problem.

All advice would be greatly appreciated. I purchased the rig for $125 (because of the multiple owners) and am wondering if repair will ultimately cost more than the purchase. Right now, I am back to my beloved other Kenwood, a TS-820 still running strong on its original final tubes!

73 and thanks in advance.

From: jmcgsd
Topic: 8424 Message: 8430

I agree with the parts cleaner solution. Had a tuning dial with similar issues on a Yaesu ft-757. I had obtained the radio from a house where the guy smoked.

First time I used it extensively, the tuning froze up solid. I went to a Radio Shack and purchased some contact cleaner then sprayed the S*&@ out of it. It worked OK for a short period of time, then froze again. I sprayed it again. Second time seemed to do the trick. It hasn't acted up since, and its been about a year.

Good luck with it and 73.

Dragged my 850 out of mothballs after 10+ years...I have the switch flipped to turn off the t/r relay for amplifier control, I run barefoot, which makes using full qsk a lot quieter...BUT...even with the 'amplifer' switch on the back panel set to 'off', there is still something sounds like relay chatter on full qsk cw. sounds like it's coming from somewhere near the "S1" internal-tuner-defeat switch.

it's much louder with the amplifier relay switched on, but it's there nonetheless.

Now, I thought the 850 used PIN diodes for qsk and was supposed to be dead silent.

So what other relay is involved, and how do I turn it off? I can't find anything in hte owner's manual about it.

TIA, Brian KA9EGW

It has a small T/R relay right at the antenna connection.

It was a comment on a forum on qth.com about ten-tec radios vs. the clunky clattery relays in yaesu's, and one poster chimed in with how silent the qsk in his 850 was. I never worked qsk much because the clattering relay drives me nuts, but I figured [or was hoping] it was just an "eye-dee-ten-tee error".

I've owned the radio 20 years and I believe it will go up for sale to buy a tentec...

Date: 2009-10-10 23:10:02 UTC
From: k7zs
Topic: 8341 Message: 8437

Only a short lived fix, the TS-450S is not keying again, so I guess I merely lucked out.

I measure 7.5v on Pin 2 of the microphone jack.

Hello Group

The radio that I thought I had fixed (seemingly by itself) has now broken itself again!

My next two measurements would be more telling, I think:

1. The SS line (Standby Switch - high is in standby, low indicates SEND position) is only showing a few millivolts on standby, but does go to ground (0 volts) when the SEND switch is depressed.

2. TXI is LOW (again, only a few millivolts). So, my understanding is that when the microprocessor says NO GO (for instance, you turned the radio on with the key down, send switch enabled etc) it will not key the radio, period. Resetting the microprocessor has no effect.

Until I can get TXI to go ACTIVE, I think I am stuck.

The microprocessor function on item 19 behaves oddly. when you switch it to OFF (disabling transmit) and after a power cycle switching it back to ON, it mutes the receiver and only a full reset will return the audio! TXB remains high (7.5v in this radio)when the audio is muted. What's with that?

Disregarding that for the moment, how can I unlock the TXI line?

Hi all,
I had a problem a few months back with my auto tuner churning
away for a while and then giving the usual beep beep telling me it hasn`t
succeeded, even though the antenna connected was quite close to resonance.
After some internal and futile investigation by me, I decided to send it
off for repair, but someone suggested it could be one of the 850`s settings,
I tried that and it resolved the problem. It has started doing the same
again and I can`t think for the life of of what it was that fixed it. It
might be that there is a fault this time, but if anyone has any suggestions,
they would be very much appreciated.

Many thanks, Johnny, GM7LSI.

8441. A solution to: TS-450 Won't Key???

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-10-12 01:04:43 UTC
From: k7zs
Topic: 8341 Message: 8441

The TS-450S is once again transmitting, and I think I know what the problem is. Could be wrong, but I think I am on the right track.

I believe there is an intermittent short in the SS line, which is the STANDBY SWITCH. This is the switch on the front panel for putting the radio into SEND. Well, the TS-450S has a feature, that if the SS line is GOING TO GROUND when the radio is turned in, it stays in RECEIVE until the line is ungrounded, and THEN it will return to normal function!

Try it - push in the SEND button and turn on your rig, then try to key it with the mic - won't key. Release the SEND button, and VOILA, all functions normal again. TXI line goes high when the rig is keyed, TXB goes high, RXB goes low etc. etc. All is normal.

Well, I am pretty sure my radio has (had?) a short somewhere in the various places that the SS line goes, and without being able to release the SS line from ground, the radio just won't key!

I still haven't found the actual short, but I am suspecting the microphone jack. Once I get more curious I will tear the faceplace off and get at the backside of the 8 pin din connector to see if that is where it is. (right now, just happy it's working)

Hope this is it, and hope someday this post helps somebody else.

Any comments???

Well, do you still have the CAR unit and does it have the YM66312 DDS chips or the standard YM6631?

Also, what else do you have seeing your reply to Cliff?

8451. NO SOLUTION to: TS-450 Won't Key

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-10-13 03:53:01 UTC
From: k7zs
Topic: 8341 Message: 8451

Intermittent operation - the WORST anomoly.

The radio worked fine (except no VOX action?) all last night, and today once again it's doing everything right EXCEPT keying, regardless of method (SEND switch, PTT or CW KEY)

I am trying to find out how the TXI line is told 'go or no go', also trying to find out if the CSS line should be LOW on receive.

any help out there, this is becoming a grudge match!

The intermittent part still has me convinced that it's a connection somewhere, I don't see transistors 'coming and going'.

Anybody out there with an idea, please SHOUT it OUT!

73 Kevin K7ZS

Hi Kevin

I found something strange here in my '450. In menu item 19, it says 'Enables (ON) disables (OFF) transmit'. I would think that setting it to (ON) would make the transmitter work, but it does just the opposite here. I have to switch it to (OFF) to make the transmitter key. Seems backward to me. 73

Kevin,

Have you checked the voltages on the RX and TX lines? So I haven't been following the thread. On the IF board, there are test points marked RXB TXB, RX8 or TX8 something like that. They should show 8V on each depending on what state the radio is in.

If you are in RX mode then the RX test point should show 8V and the TX test point 0V.When in TX, it is the opposite. If you are getting no 8V on the TX line, check the TRX board. It is a small sub board attached to the IF board. I don't have the service manual in front of me, but it is a good place to start if you haven't already done so.

Max

Hello

I live in Spain, and buy an second hand 850, and i have the follow problem:

The transceiver some time is all OK, and After 5 minuts don´t have power in AM/FM mode , A/T don´t tune and the power in SSb is down to low level.(about 10 w).

ALC is all time full display all led in transmission mode.

I think the root of problem is ALC system.

When reset the transceiver, have the same problem.

Can you help me.

Thank in advance.

Thanks to Tom and Max for good tips. Yes, the menu option 19 is counter-intuitive, but the default of OFF for TRANSMIT INHIBIT means it is NOT INHIBITED! Go figure!

This issue behaves just like option 19 is turned ON, inhibiting transmit. Everything else on the radio works fine.

On the 2 times the radio suddenly did start keying (with no particular prodding!) all of the TX8 and RX8 lines behaved properly, changing the voltage, keying properly (except for the VOX circuit which did not work - a clue?)

I am thinking that the microprocessor is being told to INHIBIT transmit, by not allowing TXI to go 'high'.

The SS line toggles correctly, being 'open' on receive and goes to ground (low) when the PTT or SEND button is engaged. The manual is ambiguous as to the purpose of CSS, which in this radio is at ground potential all the time. This line is an INPUT to the microprocessor, and I am wondering if this is how the microprocessor knows to INHIBIT transmitting.

Also, I am having trouble locating Q52, which is underneath IC11 on the IF unint. This is the transistor that starts the process of transmitting, When Q52 base goes low, it switches the transistor ON and goes on the BK IN board, which in turn goes to the TRX board. If that transistor is not switching, then of course nothing else will work. I am hoping to find a CLEAR, HIGH QUALITY scan of the FOIL SIDE of the IF board to help locate Q52. I will remove it and test it once I find it.

So, the effect on TXI by virtue of CSS is my current search, and then getting definite ID of the transistors on the bottom the IF unit.

Thanks for the responses!

73 Kevin K7ZS

8456. CSS line status is SOLUTION to: TS-450 Won't Key

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-10-13 22:06:39 UTC
From: k7zs
Topic: 8341 Message: 8456

Well, I turn the radio on today, with a logic probe on the CSS line, and this time when the radio turned on, CSS was NOT LOW! Not shorted to ground, and guess what? THE RADIO NOW KEYS!

So, I need to determine WHAT variables in the radio will cause the microprocessor to indicate CSS should be HIGH, which in turn does not allow TXI to go HIGH allowing TRANSMIT!

Is it possibly the CPU is intermittent, and triggers the 'Option 19' Inhibit On by mistake? All else works FB on this radio when CSS is not grounded.

WHAT MAKES CSS GO TO GROUND?

-Kevin K7ZS

What's hard to figure out?

"TX Inhibit" It's either off or on. Off = not inhibited.

Japanese logic.

Clif

Clif, you obviously speak and think Kenwood Japanese!!! You have interpreted the manual correctly, but probably I am not alone in this mis-interpretation!

The manual states this is a TRANSMIT feature, not INHIBIT:

Function 19: ENABLE (ON) DISABLE (OFF) TRANSMIT

To me, that means setting it to ON allows transmitting, and OFF disables transmitting. If it said INHIBIT, it would make a little more sense!!!! (NOT INHIBIT - double negative means ALLOW!)

Anyway, by now we know what it means, I am still stumped as to why the radio comes up most of the time with CSS line low, INHIBITING transmit. Can a CPU be flaky???

After 28 years of reading them the new ones are great compared to the old.

On the CSS line. I would start at the base of Q50 on the IF. High or low? It should be low. If high that grounds CSS. Then figure out where the high is coming from. If the base is low I would remove Q50 and see what happens to CSS. If it is still low from there go to the digital unit and check pin 28 of IC6, it should be high(5v). If not look for cold solder or an open on R46 which is a 10k pull-up resistor and then check the bypass cap C67 for leakage. It's fairly simple since you figured out that low CSS was causing the problem.

1. Q50 is leaking or turned on
2. R46 is open or cold solder
3. C67 is leaky/shorted

By it being intermittent I would bet on cold solder on R46.

Hi Clif - THANKS!

There is no substitute for experience, and of course PATIENCE! I have worked a lot on the hybrids, going all the way back to the T599/R599, but this is my first effort on the newer radios. Very logical, wish there was a silkscreen on the foil side for components. I need an original service manual though for better 'x-ray' views.

That said, of course now the radio has now been rock solid for the last 2 days, with numerous power cycles etc. But, with your kind contribution of the potential sources of an erroneous CSS level, hopefully I can find the intermittend and make it solid for good!

Through all of this, I now discover that the VOX circuit is not working, so that will be next.

I will share my results with the group for possible future users with the same issue!

Thanks for your contribution to this group!

Hi Kevin

Did you try the VOX with headphones on? The anti-trip is kinda touchy with the speaker. I find I get a lot better VOX action with the 'phones on. 73 Tom W7WHY

8464. TS-450 VOX not working

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-10-15 15:40:01 UTC
From: k7zs
Topic: 8341 Message: 8464

Hi Tom

The VOX doesn't work with CW either, so I know I have a fundamental problem with the VOX amp. CW, with the SEND key depressed does send, and the sidetone works all the time so the CW circuit is fine. In SSB, I had the Anti-Vox pot ALL the way down and the Gain ALL the way up, screaming into the microphone. Nada.

So, once I am convinced I have the keying issue resolved, I will tackle the VOX.

Thanks for the tip, though, the settings on a lot of radio's adjustments are a mystery why they are so radical, making it tough to find the 'sweet spot' without a vernier dial!

8465. 2 pcs of original new DDS YM66312 offered for sale for Kenwood TS-450, 850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-10-15 09:15:35 UTC
From: vojtech
Topic: 8465 Message: 8465

Hello group,
I have recently bought the offered (last??) 4pcs of YM66312 on the Ebay (I think this auction was announced here too) to repair my failed TS-450S. So two of them were currently used, soldered to CAR board and brought life to my beloved TS-450S again, and the next two are available for similarly ill Kenwood radio. They are all in original Kenwood boxes with docs, pictures and other details can be sent by email.
Selling price for both YM66312 together is 150Euro (200USD), located Prague, Czech Rep, Europe, due to next expenses with customs, VAT and postage. The price is high I know too, but I can show all the papers why it is so. It is for the similarly mad user, who likes his radio as I do, and has no heart to slaughter it for selling it for parts.

Best regards from Prague and thanks for reading and understanding,

Vojtech, OK1VAW.

Hi Bud.....I probably should have been more specific. I was trying to talk to someone who was using rig control with an SCS PTC-IIpro. It looks like they make a control cable specifically for the 850/450 at SCS. I was trying to figure out how this worked with the CAT interface cable. I guess I wouldn't need the CAT interface cable as the rig would be controlled from the computer via the modem using their cable???????

Regards,

Steve, N4JQQ

Yes, you missed it. They have a whole raft of cables for Kenwood radios. I am controlling at TS-870S right now. But, it has the interface. I am using one of the SCS cables for that. There is a cable for the 850/450. I just wanted to see how it worked.

8471. TS850 low sensitivity

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-10-17 13:42:06 UTC
From: Patrick Egloff
Topic: 8471 Message: 8471

Hi all,
I just received a "new" TS850S i've bought this week. I already have one but wanted to have another transceiver for SO2R and spare. (i will sell my TS950S)
And i can't imagine getting a better one for the price of a TS850 ! I've tested a lot of transceivers including the K3, and really i love the TS850s !!

I made some measures and found out that the "new" one has about 15dB less sensitivity then the "old" one. I can't blame the seller, because when you put the trx on an antenna, you can only notice the difference if you have a comparison possibility.

The phenomenom is global on all bands.
The preamplifier works on all bands.
The attenuators are operating.

Before i open it and put my hands everywhere, does somebody have an idea what could be wrong ?

The old one has a 3 million serial #, the new one a 5 million ! :-)
I don't think there is a sensitivity difference between production lines.

73 and thanks, Patrick.

The only problem I have seen is the attenuator resistors were bad in mine. I think it was due to overload from another transmitter nearby. Beyond that I would check the diodes and first transistor in the RX.

Check Q49 on page 121 it is a RF switch
This transistor was shorted on one of my ts-850 .
I have (3) ts-850 to compare .
And the rx had low sensitivity on one radio.
After replacing the transistor the reception became normal .
When the transistor was shorted it put a (.01) capacitor across RX line .

Hi André,

I just came on the Yahho page to send my result and in fact, i have the same problem !
I have been searching a while and finaly found out that the problem was coming from the RF board. I was expecting that it could come from a part BEFORE the board.

Injecting the signal AFTER the RF switching diode placed after the low pass filter brought the RX back to life.

To make it short, it was the same Q49 which is short... It certainly is intended to "absorb" some RF at the RX input when in TX.

So it seems to be a common problem on the TS850.

Now i have to find this transistor which has 2 built-in bias resistors. I couldn't find a seller yet.

Thanks for your mail, even if it arrived a bit late... It could have safed me some time. HI HI
Now that the TRX is open, i will proceed some mods (CW monitor level, separate RX and TX, etc...)

73, Patrick

I had this same problem and it was exactly what Clif has said..C104 had leaked...luckily not all over the board just on itself. I replaced and all is like new! I used a 16v 470uf...the original was a 10v 470uf. I know the last post was almost 3 years ago...but the more inf the better.

From: va3aso
Topic: 7822 Message: 8477

Hey Guys,
I have no tx on one of my 850s. It was working perfectly. I disconnected it to test another radio, and when I put it back, tx was dead. No output power in any mode. Tune doesn't work (as expected). Recieve is fine. I opened it up to check for any bad traces, etc. I couldn't find anything wrong. The radio does switch to transmit. The car board caps are not leaking. The radio is super clean inside. I am very capable with changing out components and very good with smt soldering. Is there something I should check right away? I checked most of the sister boards and all seems fine. Probably one of the switching diodes, but I would like some advice on where to start.
Thanks in advance.

Start by checking the RXB and TXB test points on the RF unit. Right side about halfway back.

I followed Clif's advice, found R46 and confirmed it's the proper value, and has continuity. Was unable to measure Q50 under the IF board, so removed Q50 temporarily - CSS line now HIGH. With Q50 removed, radio would not key even through CSS line was now 5v. Not sure it it is supposed to? Replaced Q50 and with it in the circuit indeed CSS is LOW. Reset CPU, alter setting of Menu option #19 - again no problem.

Bypass cap C67 does not appear leaky, but not sure I have the definitive way to test it. Used Digital VOM in ohms mode to see if it had low resistance through it. It didn't, but nor did it alter much. Will try with analog meter on low ohms scale.

So, I am STILL STUCK! I have confirmed SS works correctly, delivering a grounded signal to IC11. CSS line is good back to pin 28 of IC6 on the digital unit. Pulldown resistor and bypass capacitor appear fine.

I guess I need to find now why Q50 is being turned on, which grounds CSS. Also need confirmation that the radio would NOT key with Q50 removed.

This will be exciting IF I ever get this radio to work again!

Hi gang,
last night being an oddly low-noise one around here on mw, lf, and vlf, I was fooling around in the radio basement and as luck would have it I tried various things like attenuation and aip to try to make the situation less noisy. What I noticed was that at approximately 68kHz, if you select aip rather than the standard front end, received signals increase in strength by two or more smeter bars. WWVB was much better on aip than the standard front end parts. I guess the aip circuit offers a much better match to that frequency range than the standard front end does. At least it does so in my case. Maybe my rig is broke?

Chris

Ok. What is the voltage on Q50 base in RX? If you look at the schematic. Q50 is turned on by TXB and tells the processor it's in TX mode. No Q50, processor dumb and will not change. If Q50 is shorted the processor thinks it's in TX mode when turned on and will not key.

If the base of Q50 is low in RX then Q50 is bad.

Thanks Clif

Like a dummy, I resoldered Q50 into place after my test without fully checking it out! Not Smart!

Is there a common replacement for Q50?

I'll go through the process again and report back, THANKS!

I just recently acquired an 850 and all seems well except that I hear a "marker" or carrier on 10 MHz and 20Mhz with antenna input grounded and in CW mode. It is as though a frequency calibrator is on all the time.

I went through the manual twice but found no help.

Is this a normal situation?

what else is running, in your shack and vicinity... turn them off to see if it goes away. I dont remember a calibrator (full time) and they are usually 25 or 100 khz , not 10 and 20, so it sounds to me, it may be internally generated

Thanks, Dave, for the reply. It definitely is internally generated and behaves just like the calibrator in the old hybrid rigs. It has me baffled.

Nothing in the house or shack running at 10 MHz. When I attached the antenna and listen to WWV, it is only a few Hz away from being exactly on 10MHz.

Maybe Clif will have some advice.

From: neilgerren
Topic: 8493 Message: 8493

A couple days ago, the receiver went south (only for CW/SSB/FSK). The voltages on the product detector (IC1) are fine. However, on the bilateral switch (IC2) I'm only getting voltages on pins 5(7.6), 13(7.05), and 14(7.6).
Is it likely C42 has failed?

your right, but it should NOT be left attached.....

you add it, do the test, then remove it as far as I remember

what happens if you go different mode, could you be receiving wwv or wwvh time signal????\

I think this may be the issue. I opened the box and looked for the possibility that the 'special calibration cable' is in place but following the instructions in the manual I looked at the PLL board and no receptacle for the special cable. Thought maybe there might be a switch. Couldn't find one. Looks like more research on the web.

Dave,

This is 5M+ s/n unit and perhaps they did away with the special cable. I read some info on the web that referred to 'early versions' of the 450 using the cable. There is definitely no CAL receptacle on the PLL unit.

All tests have been run with the antenna input grounded so no external signal is being received.

The DDS Reference frequency is 20MHz +/-20Hz!

This might explain one.

Could the other also be related to the reference oscilator?

Peter,

You might be right on the 20MHz marker. I am wondering how it, and the 10 MHz, are getting into the receiver.

My other thought, since there is no place to plug in a 'special' cable, is that Kenwood did away with that feature later into the production run. Perhaps there is an addendum to the manual that tells how to calibrate the display.

Could one or more of you 5 mil or later (newer) 850 owners do a quick check for me? Disconnect/ground the antenna input, set freq.= 10.0000 MHz, mode= CW and look for about an S3 meter indication and listen for a marker/carrier? It also appears in LSB or USB with the TUNE button depressed.

I am beginning to think this is the normal calibration procedure which replaced the special calibration procedure that requires a cable.

Thanks!

Ron

Ron, the TS-850 instruction manual addresses this problem on Page 64:

"Beat tones may be heard on the following frequencies. This is due to the internal frequency configuration of the radio and is not an indication of any
problem. It is normal. 10.000 MHz, 20.000 MHZ, 30.000 MHZ"

I used to hear it on 20 MHz although not strong enough to register on the meter. If it is registering on the meter I would be a little concerned.

Hi,
I should have explained better. Not the AT TUNE, but the tune
button on the numeric keypad, (Number 7). I was playing around and found that
by pressing the TUNE button (Number 7), then increasing the LOW CUT on the
slope tune reduced atmospheric QRM static without degrading the wanted
signal as much as the slope tune used on its own does.

Date: 2009-11-01 00:40:00 UTC
From: dsh_0403
Topic: 8507 Message: 8511

I believe it is really used to "zero beat" a carrier to set the radio exactly on the frequency being received. After zero beating a carrier, when you put the radio in CW mode I think the pitch of the CW note should be what you set it for using the pitch function on the keypad.

That being said, I know what you mean about it helping receive a signal. I have on occasion when I have had a lot of time on my hand looked for NDB signals below the AM band with the tune function enabled. The signals are AM but when tune is on it seems to reduce the background crud when you zero beat the carrier on an NDB signal without reducing the modulated signal as much.

Well, no need to replace Q50, it appears good. Voltage at base of Q50 in receive is at the 8v rail level (about 7.8v in this radio).

Will start to evaluate the other logic in the Standby system.

Here's a possible clue - when it failed last time, I was in TRANSMIT and it wouldn't GO BACK TO RECEIVE! Toggling PTT, Standby Switch etc. had no effect. After a power cycle, it no longer would go into transmit.

What would THAT tell someone??!?!?!?

I am convinced that this radio is being told 'I Am In Transmit' on power up.
I know it's not via the front panel SS switch, so I am now turning to other sources for a transmit signal.

There is the CW key, the VOX circuitry, and the PACKET terminal in the rear that have the privilege of keying the rig, so I am going to try and track down each of these circuits and find out which is 'stuck' in transmit.

does this logic makes sense to anyone else, this is quite a voyage I have embarked upon!

Look at the map. The base of Q50 should be low in rx, if it is high then Q50 is telling the processor it's in TX at power up and it will not work. Sure what happened made sense. Something shorted locking it in TX mode. When you power cycled it it came up in RX and the processor saw the low on Q50 and will not go into tx.

Check the voltage on the anodes of D47 and D73. That will tell you where the TXB is coming from, sorta.

There are a number of different frequency step functions set through the power-on function feature. You can download the manual from our Files section under Manuals and Schematics.

Just bought a nice Kenwood TS-450SAT and wanted to ask this group for your personal opinions. I'm wanting to talk well and receive well in crowed bands, Digital and Voice , PC control with Logging. What Kenwood radio would be best to achieve this ? I realize that a SSB filter would be needed, but what else would you recommend ? Looking for Pros and Cons and will buy amplifier later on to him some.

Thank you

Thank you Clif for confirming my suspicion that this part of the circuit is working properly, and it is being told that it's in TX on power up.

I'll keep the list posted, I'll be on a trip for a while but the radio isn't going anywhere until it's fixed!

I agree with Tony. I have a 850 with the Inrad 2.1kHZ filters in both IF's and the Inrad roofing filter. I do a fair amount of contesting and lot's of DX'ing in SSB and digital and it is a dream radio for that. I found the the 1.8 filters are a little too narrow for my taste. With the 2.1 I can used it all day long and it is very comfortable on the ears. There has been a couple of posts that say the roofing filter takes about 3db away from the receive signal but I dispute that. I just got a Wavetek signal generator that will go down to -150db and I lose it at -142db in my 850 if it had a 3db loss I would not be able to hear anything below a -130db. I also tested a K3 with the Wavetek and it lost the signal at -139 with no DSP on. Sure the 850 has no DSP but it's receiver is HOT. So if you want a great Radio for any aspect of HF work the 850 is the way to go for the money.
73 and good luck

8526. TS-850S/AT in ebay store

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-11-06 18:34:08 UTC
From: Thierbach, Ed
Topic: 8526 Message: 8526

Just FYI - as many of you probably know, Burghardt's is no longer a ham radio dealer, and they've been slowly selling off some of their inventory on eBay. They currently have a TS-850S/AT for sale:

http://cgi.ebay.com/Kenwood-TS-850S-AT-160-10-meter-HF-TCVR_W0QQitemZ280419715963QQcmdZViewItemQQptZLH_DefaultDomain_0?hash=item414a514b7b

I have no connection with Burghardt's, just passing along something I saw.

8527. RLS 135 pin diode

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-11-08 01:14:16 UTC
From: gabby2white
Topic: 8527 Message: 8527

I had a pin diode (D16) short in the BPF circuit selection area of the RF board. I clipped it out and performance is restored.

I did a search on the web and Yahoo groups for a replacement and found nothing but did find RF Parts carries them at $3.50 and a $25 minimum order.

Is there a crossover part number? Or another source that will sell three?

Can I sub a 1N914A switching diode in its place?

TIA,

Ron

Hi
Where the factory bothered to employ pin diodes, you should replace it with the exact same or a better pin diode. Most none-pin diodes are hit and miss as far as performance in rf environments goes. The 1ss53 diode isn't a pin diode but it is excellent at rf switching in most cases. Some of the other run of the mill switching diodes like the 4148 are about as bad a choice as you could possibly make for use at rf. They create loads of intermod when rf is present, and have other characteristics just as bad at rf. The 914 may be the same but I do not remember seeing test results on that exact part number.

Chris

I got some PIN diodes years ago from a place in Arizona called MHz Electronics or some such. I think they went out of business.

There was also a place called Microwave Components of Michigan that had some. Norm also went out of business.

I don't recall seeing that particular part number anywhere. You might check out http://www.rfmicrowave.it and see if they have something comparable. They are in Italy but their prices are very reasonable and I've gotten good service from them.

Also, doing a Google search for the part number may turn up something.

Hello group, this happened the other night with a long QSO to Hawaii...and a couple of other times. The radio got pretty warm...this seems to happen only when the radio gets hot. When I unkey the RX drops out for a second or to..choppy and the S-meter goes to zero...it may drop out two or three times then recover...real hard to have a QSO!! No antenna tuner, no NB, checked SQL and RF gain settings, checked antenna port, jiggled and moved things around and can't a make it happen. When radio cools down everything is good. Any ideas? -Dallas. ki6pdi.

Take the covers off, power the unit up, and heat things up with a blow dryer.(or ,very carefully, with a heat gun with small nozzle).... Get a couple cans of cooler (freeze spray) and spend some time locating the problem
PC board interconnect connectors are notorious for thermal intermittants..... as are cold solder joints.....
Hope the suggestions help....

Thanks

Please search the previous posts for leaking capacitors or similar. There are some parts that need visual inspection and possible replacement. The caps leaking can cause some serious damage, which is repairable but painful. Preventative inspection could save a GREAT rig. You should go through the files section, look at what is there and some of the pictures to get a better idea of what others have done, either for fun or necessity.

BTW, how much did you pay for your 450, and what specific model and options does it have? I.e. does it have the tuner, any filters etc?

Sounds like either the antenna to SO-239 connection is intermittent, or it's about to drop out of lock....If there is no noticeable distortion on received signals just prior to it occurring, I'd check the RF connection first.
With heat-cycling, RF, motion transferred to the wire from connect/disconnect cycles etc., the soldered connection tends to weaken, which starts a run-away but usually slow connection break-down.... 73...Jordan....

Hello Group, about a few months ago I had the notorious YM6631 DDS failure on my TS-450s, so a myth, that the YMs die mostly on TS-850s due to the leakage caps seems to be not true. I am curious, how many of you have encountered the same problem and had to replace the CAR board or the DDSs?
When I repaired it, I made an inspection of the boards, but the caps seeed to be looking like new, no leakage on car board or anywhere else. Has anybody from you met with leaked caps in the TS-450s?
Any info about a recommended prophylaxis on a fast twenty year radio would be great, to do all toghether.
Regards,
Vojtech, OK1VAW.

P.S.: the two offered YM66312 some time ago from me here are sold.

A lot of problems with parts are heat-related. Components expand internally when they get warm and contract when they cool off. With the passage of time, this may cause tiny fractures internally in the various devices. They will usually break contact internally when they warm up and make contact when they cool off. A device that has ceased to function at room temperature may start working when cooled to, say, 40 degrees.

So by spraying cooling spray, if the device starts functioning again, you know you've found the culprit.

If there is a marginal/intermittent connection, the freeze spray forces contraction and makes the problem occur, thereby isolating it's location.

Hope this helps.

Can someone explain how the freeze spray works at diagnosing problems ?

The trick to using freeze spray is being able to cool down one (or a couple) suspects at a time ideally, but in some fashion narrowing it down to a particular location.

Thanks for the Burghardt tip. I ordered several this morning that will ship Priority Mail.

They are also available at Kenwood Parts: $1.42 ea. plus $11.50 shipping! Yikes!

Hi
Before you remove the suspect parts, try to resolder their respective connections and test again. I recall a story by a guy in the same situation as yours and he removed and replaced a suspect chip, but then later tried the suspect chip in another rig and it worked, making him think that solder joints may be the culprit here. Worth a shot?

Hello Chris,
I have to say that I have tested the DDS quite thoroughly on a microscope looking to a PCB and soldering problems, but all looked allright. The failed DDS gaves a second harmonic or other strange output signal, it seemed that it was not able to react to the digital setting. I was looking to every pin even with a with spectrum analyzer for Rf signals and oscilloscope for digital ones as well.
After desoldering the old one and resoldering a new YM66312 it worked immediately, so in this case I am sure, that it was failed YM6631. Replaced both to be sure.

On the other hand, can you estimate, how many TS-450s (TS-690s) have you on your table with failed DDS as the primary failure in comparsion to other failures in comparsion to a TS-850S?
Regards,
Vojtech.

8552. What filter is best for TS-450sat

I have a nice un modified TS-450sat and would like to be able to use it in contests and crowed channels. I like the digital modes like packet, psk31 etc. and SSB. Do I want to get the INRAD combo

http://www.inrad.net/product.php?productid=20&cat=47&page=1

or will the Kenwood optional filter be as good. Hopefully will sell this one and upgrade to a nice TS-850sat later or ??. Are there any more modifications that might be good for this radio ? 60m mod ?

Thank you
Ken

Hello Bill, you can try Pacparts.com, the mic pot is # R05-3462-05, I ordered one over two weeks ago...they say they will definitely get them in this week! I hope so. I was able to adjust mine with a screwdriver for now and just leave it. This seems to happen a lot due to poor packing! Hope that helps Bill.-Dallas. Ki6pdi.

The Inrad filters are much better than the Kenwood filters. If you can
afford them, go for it.

Hi Vojtech,
I have no experience with the 450, but there are some here who are qualified to answer your question re 450 vs 850 failures, Clif being one of them. Perhaps he will chime in with his thoughts. I had heard that the early dds chips were failure prone, but some malfunctions are likely to be soldering failure. Anyway, glad you are good to go now!

My TS-450S generates a wide variation in output power over the different operating bands. I tested it into a dummy load using a known good watt meter and found that the CW output power level varied from approx. 50 watts on 160M up to 120 watts on 20M and back to 50 watts on 10M. Also looks like the rig's SWR indication is out of whack which may be causing the problem or at least lead in the direction of the problem. Anyone see this behavior before? Any good ideas on where to start looking? I own a o'scope so I can do some diagnostic work. I am hoping someone has seen this before and can point me in the right direction.

Thanks, Art K6AKR

Start by making a chart.

Band Power out SWR Current drawn

Also leave the tuner out of line. The chart will tell you if it's a LPF problem or an SWR circuit problem.

Did it just start doing this?

Clif

After some head scratching I need some advice. I've never made a RTTY QSO in my life but want to play around with RTTY and other digital modes like PSK. I have constructed a soundcard interface from Unified Microsystems (http://www.unifiedmicro.com/sci6.htm) and need some help on connecting to my 850.

I rarely operate phone and need to know the best way to interface the soundcard interface to the 850. Should I just use the front panel mic and headphone jacks or should I use one of the back panel jacks on the 850? If so...which one? The sound card interface has a trim pot for adjusting the transmit audio and I assume the software running on the computer will allow you to adjust the audio coming from the radio to the computer?

Finally....how should I handle the PTT?? Again, from panel mike jack or one of the rear panel connectors??

I realize I won't have FSK...only AFSK but that's the trade-off when you want to work the other digital modes...correct???

Hi Gary

You might Google 'RASCAL'. I have 2 of those interfaces on my TS-450SAT's and they really work great. You can plug the cable right into the jack on the back of the rig and it takes care of PTT, FSK, etc, very nicely. I think I paid around $40 for the ones I have.

You just plug the cable into the radio and into a serial port on your computer and you're good to go. 73

Get a pinout for your mic, you only need the mic audio and ground for audio in. You can simply use vox for the keying, which is solely working off the audio from your computer (watch-out, or you will transmit the 'you've got mail' notification though) and is incredibly simple to operate. A dedicated 8pin plug is very simple to setup, and by using this INSTEAD of your mic or passthrough devices you will never have a live mic during your transmissions.

You should set the mic gain and volume level from your computer so your ALC is NOT peaked, in fact just registering the alc is as high as you want to go. If you send too much audio and the alc comes in, then your signal will get clipped and it will cause splatter. Generally, you only need enough audio from the computer into the radio to trip the vox. The audio from the computer is already compressed and optimum, no compressor is needed.

In your digital app, you can send a continuous set of dits or dahs and use this to 'tune' the volume. Start out with volume on the pc at 0 and slowly work it up (click on the volume slider and use the up/down keys on the kybd to increment.

Audio in to the computer, turn off all filters (the software does the filtering and radio filters could reduce effectiveness), turn the volume down all the way, on both the radio and the computer. Raise the volume on the computer mic-in or audio-in to half, slowly turn up the radio volume. On my 450 and other rigs, the radio volume is usually so low that the radio volume is too low for my taste just for listening to. Your app should have a meter to tell you when you are overdriving the receive audio.

Power, only run 1/4pwr. digital modes run your radio at 100% during the entire transmission, whereas voice has highs and lows and is rarely over 50%. This is called the duty cycle, too much power and you will damage your rig. Plus, digital modes are designed/optimap for weak signal use. Try with power at the lowest setting, and raise it as you need. You would be amazing how far you can go with the lowest power setting! It is also
bad etiquette (I wish others would pay attention to this bit) to use an amp on PSK. If you use too much power, you often end up washing out the whole frequency, I have seen harmonics of the same overdriven signal appear 3-4 times on either side of the tx frequency... which is no fun. Don't be that guy. Do some test qso's with a friend to identify your signal and how well tuned it is. A little goes a long way!!

Take this simple route to get on the air and get your feet wet. Many good qso and dx contact can be made with a mic held up to the computer speaker... so don't underestimate the simplicity of audio coupling. When you have some experience, you will see what you do and don't like about your setup. Then, add rig control, or computer ptt control or other things. It is a very fun

mode, and starting out cheap and easy will teach you much more than buying gear and connecting the color coded connections.

73, I will watch for you on 14.070, I talk to my Father in Anchorage a lot there... and 20m PSK-31 is always popular is seems.

btw, that looks like a good kit, thanks for the link!

My goal (in some weekend of free time) is to mount a small usb hub and a small usb audio device inside an interface like this. A poor-mans signal link, so to speak. I do computer repair and have lots of this kind of thing floating around. As it is, I still use an altoids tin interface I built, with a simple 2 resistor circuit to reduce the pc out volume into the mic, no isolation though.

My 450 has no audio from the mic jack... even if the manual pinout says it
does. Sorry charlie.

I think you would be better off buying an interface cable designed for the Kenwood radio. You would use the ACC2 jack and it would make your life a lot simpler. I believe when you are feeding data to the radio via the mic jack, you have to bring the audio out of the jack on the back of the rig. I might be wrong though. The ACC2 jack is the way to go. I imagine the device manufacturer offers an interface cable.

Pin 6 is a NC "No Connection". There is only Mic Audio IN and NO Audio out on the Mic Connector. This is for a TS-450SAT and I will think it applies to most 8 pin mic connectors on Kenwood Radios.

Thank you

Signalink does make a 13 pin din cable for the kenwood and the interface works great that way. I have one hooked to my 850 and Love it. So I would order one if I were you. I use it with DM780 (part of the Ham Radio Deluxe package).

Hello Dave,

This was the answer that I thought I'd hear. I like this idea since the receive audio is fixed.

Now....does anyone have a catalog number for the 13 pin accy plug? I'm really looking for something like from DigiKey/Mouser/Newark, etc....

KD0ZZ, looks like you have the answer. I have that plug from a previous project and I could make up one for the Tigertronics.
How are your pins configured to the Tigertronics plug? It looks like I can use a regular PC network cable (without going up to the shack and looking).

Topic: 8576 Message: 8576

Sorry! It was silly of me to leave out the most obvious thing: what rig I am using.
Kenwood TS850S.
I ordered the "right" cable from Tigertronics, but don't get any audio information into the unit to send to the PC waterfall. I have been able to simply run headphone>PCs soundcard and I get great audio--but that's not how it's supposed to work, ha ha.
Any tips?
Jonathan KC7FYS

Aloha Jonathan,
The 850 has no audio out at the Microphone plug in the front of the radio the only way to get audio out is thru the EXT. speaker/Headphones or the fixed audio level on ACC2 pin 3. and since Tigertronics has the cable pre-made all you have to do is set the jumpers in the Signalink. You might want to unplug the cable from the interface when using 40M SSB as mine has a bad RF feedback problem on 40M but I just unplug it and no more feedback. I just unplug it from the interface since that is the fastest way.
I have had a lot of fun using mine for the past couple of years. I have worked almost all the digital modes and CW with it.
Good Luck
Roland AH6RR

I am going off-topic here a little bit but I'm interested in the outboard sound card boxes like the Tigerlink USB. The idea of having volumn controls at my fingertips vs. having to dig into the computer's menu is attractive, especially if you are running different programs. Further, it is a hassle trying to deal with speakers, digital modes, etc. simultaneously.

Am I missing something here????? It looks like there are about four devices out there that accomplish this purpose.

Steve, N4JQQ

Thanks for your patience.

Aloha Steve,
You cant go wrong with the Signalink USB by Tigertronics. It is a execellent choice for operation and price. Since it has it's own built-in sound card you wont get the Windows Sounds being broadcast on the bands. It is easy to use with any software and it is easy to set-up.
Have fun
Roland AH6RR

I just got a Signalink USB and the matching cords for the 870 and 480. It was painless, AFTER I read the instructions, GRIN.... Seems to work fairly well.

8582. Re: TS-450S Power output variation

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-11-18 20:34:43 UTC
From: k6akr
Topic: 8556 Message: 8582

Good suggestions. I setup my newly acquired TS-450S into a 50 ohm dummy load with power determined by my calibrated LP-100. First are the results for the newly acquired TS-450S.
Freq(Mhz) Pwr(W) Supply Current(A)
1.8 62 13
3.5 87 16
7.0 102 16.5
10.1 112 16
14.2 120 20
18.1 122 20
21 125 20.5
24.9 104 16
28 84 16

In looking at this chart I note that while the power at both ends of the HF spectrum is down it is still more than adequate. But if there is a simple fix why not give it a try? It is also a good learning experience.

I own another TS-450S (an AT version) which has been my main HF rig for the past of couple of years and which has been working very well. For this rig I had the following results:
Freq Power Supply current
1.8 105 18.5
3.5 109 18.5
7 109 17
10.1 108 17
14.2 105 20
18.1 104 18
21 102 19
24.9 100 17
28 99 18

I used my oscilloscope to look at the input signal to the LPF board just after the RF amp on both xcvrs. You can quickly see why a LPF board is needed. The output of the RF amp is an ugly looking waveform. I also note that the LPF board attenuates the signal by differing amounts versus frequency which requires differing amounts of drive to compensate. From studying the service manual I am going to try the following steps:

1. Measure and adjust standby ALC voltage is necessary
2. Adjust VSF as needed to limit output power to approx. 100 watts at 14.2 Mhz.
3. Adjust VSR as/if needed for correct power limiting as SWR increases
4. Adjust freq compensation as/if needed in the SWR bridge on the LPF board that drives the differential amplifier that forms part of the ALC.

These look to be fairly simple adjustments to make. The new rig seems to really cut back power as I varied the SWR (I changed the length of the drive element on my steppir beam to do this) so it looks like that the VSR will need to be corrected. It may very well be that I am seeing several problems at once for which I will need to work my way through. On both

rigs I noted that the onboard SWR indication is much lower that the true SWR from the LP-100 (cabling will make a bit of difference here but not enough to account for the difference in indicated vs. measured SWR).

If this doesnt adequately correct the problem I will have to look deeper into the CAR board and study how the rig internally adjusts the drive versus frequency to compensate for the varying amounts of attenuation by the LPF.

Any further suggestions, thoughts etc. will be much appreciated.

Do the null adjustment, Pg 124 step 7 in the manual. That will probably take care of it.

No manual, take the cover off the final and look at the filter unit. Locate TC-1. Now find CN8 Pin 1. Go to 3.5 MHz Cw mode and turn the power down to 10w using the power control. When keyed adjust TC-1 for a minimum dc voltage, it will be in the millivolt range, measured at CN8-1.

Try the power checks again. If still bad you may have to adjust the SWR circuit.

From: Patrick Egloff
Topic: 8588 Message: 8588

Hello, Has anyone made two tone tests on an TS850S ?

I bought another one, 2 weeks ago and had bad modulation reports. I realigned all the TX and made some IMD measures.
If good at low level up to 50W (-33dB) , they get worse at higher level and with a -17dB at full power.

Hi Patrick
The 850 seems to have very poor imd on tx at rated power per the qst review. I wonder if a final swap of some type would make the rig cleaner? Or maybe tuning the bias a bit better. Other 12v final rigs have great imd, the IC765 for one.

Running just a bit under 100w and with no alc indicated is probably the way to get a clean output with a stock 850.

Chris

I don't think there is a way to make the tuning wider than the basic 10 Hz steps using the tuning knob on SSB/CW. You can, however, set the M.CH/VFO.CH knob to provide 1 kHz steps in tuning. See Option 03 under the "Power On Function Selection" section 4-10-15 on page 35 of the instruction manual.

QST did criticize the 850 for its transmit IMD, but it tested it to be -28dB, worst case. That's a lot better than -17db, and actually puts it in the range of many of the rigs that have come along in later years, which are no longer criticized in the reviews. For instance, worst case IMD for the ICOM IC-746 was -23dB.

I've never heard an 850 that sounded bad, regardless of what the tests say, unless there was a problem with the rig. And I've worked many, many of them, and owned one, since 1991.

You could use the M/CH knob. This will tune the 850 in 1 kHz steps
(integer freq only).

Probably not what you are looking for.

Or, are you looking for 1kHz per knob revolution?

Greetings,
I have been lurking here for some time and was able to acquire a used TS-2000. I need to sell the 450 and stock microphone to pay for the TS-2000. I'm asking $500--it's in good shape (great shape except the memory knob is flakey). I have made contacts in Florida and Hawaii from here in California. It's my first HF rig and was used when I purchased it. If you would like more details please email me at mrpasssport<at>yahoo<dot>com. I subscribe to the digest so expect a delay of at least a day or two if you respond to the list. (I also have a PS-50 power supply)
Thanks,
Steven

Hi guys

I am looking for a 1 kilohertz tuning step, and I fear that this is not something the 850 can do.

8597. Re: TS-450S Power output variation

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-11-20 05:26:16 UTC
From: k6akr
Topic: 8556 Message: 8597

I did the following adjustments as described on page 124 and 125 of the service manual for the TS-450S:
ALC null
ALC
ALC freq response
MIN power
and I adjusted the power meter display and the SWR power limiting.

The rig now puts out a min of 94 watts to a max of 104 watts from 160M to 10M.

Thank you for your suggestions and encouragement.

73, Art K6AKR

> >
> > I used my oscilloscope to look at the input signal to the LPF board just after the RF amp on both xcvrs. You can quickly see why a LPF board is needed. The output of the RF amp is an ugly looking waveform. I also note that the LPF board attenuates the signal by differing amounts versus frequency which requires differing amounts of drive to compensate. From studying the service manual I am going to try the following steps:
> >
> > 1. Measure and adjust standby ALC voltage is necessary
> > 2. Adjust VSF as needed to limit output power to approx. 100 watts at 14.2 Mhz.
> > 3. Adjust VSR as/if needed for correct power limiting as SWR increases
> > 4. Adjust freq compensation as/if needed in the SWR bridge on the LPF board that drives the differential amplifier that forms part of the ALC.
> >
> > These look to be fairly simple adjustments to make. The new rig seems to really cut back power as I varied the SWR (I changed the length of the drive element on my steppir beam to do this) so it looks like that the VSR will need to be corrected. It may very well be that I am seeing several problems at once for which I will need to work my way through. On both rigs I noted that the onboard SWR indication is much lower that the true SWR from the LP-100 (cabling will make a bit of difference here but not enough to account for the difference in indicated vs. measured SWR).
> >
> > If this doesnt adequately correct the problem I will have to look deeper into the CAR board and study how the rig internally adjusts the drive versus frequency to compensate for the varying amounts of attenuation by the LPF.

I tested it into a dummy load using a known good watt meter and found that the CW output power level varied from approx. 50 watts on 160M up to 120 watts on 20M and back to 50 watts on 10M. Also looks like the rig's SWR indication is out of whack which may be causing the problem or at least lead in the direction of the problem. Anyone see this behavior before? Any good ideas on where to start looking? I own a o'scope so I can do some diagnostic work. I am hoping someone has seen this before and can point me in the right direction.

I think he wants to be able to tune in 1 kHz increments, faster than the
tuning knob allows you to tune.

73, Zack W9SZ"

This is precisely what I am looking for... and most every other pll rig has provisions for this, oddly enough. I could use the mem knob but I fear it wont last long in that use. Much rather use the vfo but I see there's no way to step in 1kc increments. I want 1kc as most every station is on a whole kc, not .05 or whatever. Makes bandscanning much better. And when I say bandscanning I mean an excursion from mw to 30mHz. Guess I will settle on 5kc via mem knob till it falls off. Thanks for the replies.

Chris

8599. Needing filters for SSB and Digital "non CW" for Kenwood TS-450SAT

Hi Chris,

Follow this procedure:

1) Press and hold the LSB/USB key while turning the power button on.

2) A number will appear in the display.

3) Rotate the M.CH/VFO.CH knob until the number 03 appears.

4) Push the UP or DOWN buttons until the number in the center of the display reads 1 kHz.

5) Turn the power off and turn it on again.

Now the M.CH/VFO.CH knob will step in 1 kHz steps. Once you find the signal you want you can use the main tuning knob to fine-tune it.

I don't know how many turns these switches are rated at but I haven't worn mine out yet.

8601. TS-450S no output, infinity SWR value

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-11-21 05:45:47 UTC
From: Ron K6KYJ
Topic: 8601 Message: 8601

I have a Kenwood TS-450S (w/o the internal tuner). I am at least the third owner of this transceiver. The follow situation has now occurred four times; the first three occurrences, the problem self-corrected. It is now persistent after the fourth occurrence.
The problem. During normal operation, in both cw and ssb mode, the rig suddenly produces zero measureable output AND the SWR display presents a bar fully to the right (infinity SWR).

During all four occurrences, I immediately checked to see if a load was present; at all times, there was a valid load (antennas that presented SWR readings of less than 1.5:1). After each occurrence, the rig was immediately connected to a dummy load and the infinity SWR reading was still displayed.

As previously mentioned, the problem self-corrected after the first three occurrences. I have no valid explanation for the rig returning to normal operation. The obviously tricks and black magic have been tried (touch, tap & whack etc.). Currently, I am trying to trace continuity from the SO-230 to the FILTER network. As soon as I can get an RF probe built, I will begin trying to trace the RF path from the FINAL circuit board. All tests that I have done after output failure are done with the lowest possible setting of the CARRIER and POWER controls.

Any advice would be appreciated. My purchase price was $125 since the rig's history is pretty long. I am not sure how much I want to commit to having it commercially repaired. My background is geography, so I don't pretend to be an electronics whiz. (I grew up building vacuum tube rigs.)

My personal suspicion is a bad solder joint somewhere or an intermittent connector.

Thanks in advance.

Ron K6KYJ
Chico CA

Zack, Chris...

I thought I knew that the M.CH knob is actually an encoder with a detent so there may not be a mechanical contact issue. At the same time, a while ago several people here were looking for replacement encoders for the M.CH function.

Hi Ron,

Does it do this on all bands? And did you connect an external SWR/power meter to show if it was actually putting out power?

If it isn't, I'm guessing a bad solder connection or relay somewhere.

The Realistic HTX-100 also uses an encoder with detents for its
main tuning but I've worn out a couple already. The detents start wearing
down or something.

It's gotten a LOT of use - that (modified) HTX-100 is my IF rig for
VHF/UHF/microwave transverters.
I don't think it's difficult to replace that M.CH control once you get your
hands on one.

Yes, across all bands into the dummy load and with an external power/SWR meter. Not even showing a watt of output. As soon as I can rig an RF probe, I will check to see if there is any signal at all into the filter circuit board. Working backwards from the SO-239 does not show any obvious faults in the signal path into the filter board.

Now, its time to wire up a microphone for my TS-820S...sadly, Sweepstakes has a SSB weekend also.

The ammeter on your power supply is your friend. Low current in tx and it's before the final. High current and it's after the final. As long as the finals are good of course but it will answer questions and point in a direction to look.

As soon as I can rig an RF probe, I will check to see if there is any signal at all into the filter circuit board. Working backwards from the SO-239 does not show any obvious faults in the signal path into the filter board.

Hi all..... The ALC meter on my ts 850 seems to be having odd fluctuations. And when I transmit I'm not sure if anyone is hearing me. Or maybe my finals are fried? The antenna tuner works no problem there. And the swr was checked on my antenna with my anaylyzer 259b which was 1.2:1.....I'm not sure how to start trouble shooting this. Any ideas? Thanks

8612. TS-850SAT receiver noise problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-11-22 23:46:56 UTC
From: Brian Mileshosky
Topic: 8612 Message: 8612

Hi Everyone -

I'm having a receiver noise issue with my TS-850SAT, and I'm looking for ideas on what it might be. My 850's serial number is 30-million series. According to some (unverified) information I found on the web, it looks like this might correspond to having been built in 1991.

Here's the problem:

--- My 850 is experiencing loud, intermittent, crashing, static-like pops in the receiver. Sounds like static crashes from nearby lightning strikes.

--- I've confirmed that the noise is originating from within the radio, and no external sources, as I've operated the radio with a 50-ohm load connected to the antenna port (as well as an open), on battery power, and no cords or cables other than the power cable attached to the radio.the crashes still occur.

--- The crashes register on the S-meter, which tell me that it's occurring in the receiver chain prior to when signal is coupled into the S-meter.

--- The crashes get louder (and stronger on the S-meter) as I tune to lower frequency bands, which makes sense.

--- I have not been able to correlate the occurrence of this noise with temperature. Seems somewhat random as far as when the problem begins after I turn the radio on, and also when the crashes occur.they range from once every 10 sec to sometimes more than once a second.

--- I've looked at each of the LOs in the receiver with an o-scope and they are both on frequency and look clean.

--- Poking elsewhere in the receiver chain with my o-scope hasn't shown any apparent noise at the time I hear crashes on the speaker.

Any ideas?

Thanks and 73,

Brian N5ZGT

Look closely at Q49 on the RF unit. I think you will find it has been fried. If it looks good check the collector for 12v. If not there or fried replace it. Do not transmit on the radio with Q49 missing.

Here's some info gleaned from the 850 repair page re an alc fix:

"My TS850 developed the ALC problem abt 3 years ago, but I did buy a new rig and the TS850 was put in reserve status. Then I found on your website information about this problem. I checked my TS850 and it had still that problem. So I removed the PCB with the dc-dc convertor and put it on the testbench at work. I checked C626 and C628, they where wrong on the schematic but they are OK on the PCB. I fed the DC-DC convertor with 12.5 V at L605 and it worked fine, output was -6.2v. But when I lowered the input voltage strange things began to happen. At an input voltage of 12.43v, the output voltage started to go down and up. When I checked the oscillator signal on C625 (output of oscillator) it fell regulary out and started up again . The problem got worse with lower input voltage and the dc-dc convertor stopped working at about 11.9V. So I concluded that my PCB was working ok, but that the input voltage in my TS850 was low (maybe got lower with aging). I was at my work and my TS850 at home, so measuring the voltage was out of the question.

So I tried the following: I changed resistor R2 and R3 (on the dc-dc pcb) from 22k to 18k and checked again. What I found now was that the dc-dc convertor worked fine from 12.5v down to 9.5v. Back at home I then put the PCB back into the TS850 and now have again a rig that
is working fine, ALC and output are stable now."

My kenwood ts 850 is transmitting on a different frequency than I recieve on. I looked into the obvious things like the F Lock button... The RIT & the XIT button. I did a soft reset also. The rig was working fine before. No one can here me because I'm way off frequency. A frequency counter I have is telling me for example if I transmit on say 14.180 the frequency counter says I'm transmitting on 14.150mhz ..... The same on the 40m band .....I have a service manual but I need to know were to start looking. I hope I'm explaining this ok. The frequency counter is working ok because I checked it against my backup radio. Can anyone give me some info on this? Thanks

Start on the Car unit, home of the DDS chips.

IC1 is used as a VFO and outputs a signal from the Car unit that ranges from 4.95-4.45 MHz according to the frequency. My notes show that at 14.2 MHz CW mode, in RX the frequency is 4.749311. Each of the DDS chips has 2 sides "A" & "B". For simplicity "A" is RX and "B" is TX. In TX the frequency should shift to 4.750011 giving a 700hz shift. Disregard the last 2 numbers as that's how far off frequency the reference oscillator is. The main thing is the shift. Try it at several different 20m frequencies, the RX side will change with the VFO knob and the TX side should follow it although offset by 700Hz.

I think you will find the "B" side of IC1 is stuck and not changing.

Let us know.

Are Rx & TX on the same VFO? When you press the TF+SET button, does it show the transmit frequency? If so you are operating split.

Ok... Here is some info. I tuned to 14.200 MHz transmited cw.. And my frequency counter tells me I'm at 13.779 MHz . The same at 14.300 and again at 14.020. The counter always says my signal is at 13.779 MHz . And on the 40m band the frequency counter tells me I'm at 6.778mhz. I double checked the counter with my backup radio and it appears to be working fine. Any more ideas??

I just removed the car unit in my ts850.....looks like someone who owned it before did some repairs on it. There are some new caps in there. I dont really know what to do with the thing now. maybe replace all the caps. There dosent seem to be any burnt traces..

Put it back in and measure the frequencies coming off of it. At least then you will know what the problem is. From that you can figure out a cure.

Im not sure how to verify that...But i do have the car unit out now.

The counter always says my signal is at 13.779 MHz . And on the 40m band the frequency counter tells me I'm at 6.778mhz. I double checked the counter with my backup radio and it appears to be working fine. Any more ideas??

> > >
> > > IC1 is used as a VFO and outputs a signal from the Car unit that ranges from 4.95-4.45 MHz according to the frequency. My notes show that at 14.2 MHz CW mode, in RX the frequency is 4.749311. Each of the DDS chips has 2 sides "A" & "B". For simplicity "A" is RX and "B" is TX. In TX the frequency should shift to 4.750011 giving a 700hz shift. Disregard the last 2 numbers as that's how far off frequency the reference oscillator is. The main thing is the shift. Try it at several different 20m frequencies, the RX side will change with the VFO knob and the TX side should follow it although offset by 700Hz.

> > > > A frequency counter I have is telling me for example if I transmit on say 14.180

the frequency counter says I'm transmitting on 14.150mhz ..... The same on the 40m band .....I have a service manual but I need to know were to start looking. I hope I'm explaining this ok. The frequency counter is working ok because I checked it against my backup radio. Can anyone give me some info on this? Thanks

What tools do you need to measure those frequencies? Just for my own reference. I have a VOM and an antenna analyzer with a freq. counter on it, would those tools be sufficient?

I thought the Carrier Unit generated several different RF signals at the same time, which get mixed together to create the final output. The different DDS chips have different offsets depending on the band and mode (usb/lsb/am/fm...). You need to look at all the signals. Having a block diagram of the radio in front of you with the mixing scheme outlined will be a big help! (or, if you don't have that information, I doubt it will make any sense at all).

Maybe not so rare as you think. I thought my TS-450S would not have those problem with the CAR board and DDS. It had. First it took seconds up to minutes, when the radio (DDS) started (see my old posts about that on forum). After one last unhappy?? switching of power supply with the radio power button on with the voltage rises from zero to 13.8V it did not wake again, maybe the last "coup de grace" to the ill DDS chip.
When I studied in this errorneous state, what was coming from the DDS on spectrum analyzer, it was a strange signal (fast rectangular) full with harmonic with double frequency, than it should be - it seemed that some of the outputs of the DDS doing strange work.
After replacement of the YM6631 to YM66312 all went to normal again.

I would like to know the opinion of Cliff or somebody, who repair those radios regularly, how many of CAR board (DDS) had to be replaced, and if it is more often on TS-450 or TS-850?
When I asked even here in the hearth of Europe the people having TS-850, lots of them had to repair or replace the CAR board due to the failed DDS.

Vojtech, OK1VAW, Prague.

Hey Wes,
I wouldn't bring it to radioworld unless you have lots of money and time to waste. I know a tech in T.O. that may be able to help. He is pretty good with the 850s'. He does all my work, and is very reasonable.
He just changed out one of my DDS chips with the updated one which is still available here NEW! Give me a email, and I will give you contact info if you like.

From: ryverwes
Topic: 8632 Message: 8632

Looking at my car unit.... There are three 6631 chips and one 66312. Also looks like a few caps were also replaced as well. There appears to be no leakage around IC1. From what I've been reading I think the problem is IC1. Is the an equivalent chip out there? I should replace them all anyway.

8633. FTDI Cable

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-11-27 15:23:59 UTC
From: kremper4-850@yahoo.com
Topic: 8633 Message: 8633

Some time ago information was provided regarding an FTDI cable that can interface a TS-850 to a computer via the USB port. I believe this enabled the '850 to operate various digital formats (PSK, RTTY, etc). I *think* the cable connected to the '850's ACCY socket. The cable was low-cost, too: about $20 or so.

Does anyone have that information?

Tnx ex 73,

Paul:
I believe this is what you're looking for.
Luckily I keep all these informative emails.
I had bought the chip that Rob talks about, but I wish I had waited and bought the cable with the chip built into the usb connector.
Mouser has the cable, just search FTDI TTL232R on their site.

Hope this helps

I have been doing some thing very similar for the last couple of years. I use the FTDI TTL232R cables. They have the chip built right in the USB cable. All you have to do is make a 2mm header and away you. I have built many of them for friends. I also use one on my FT1000. They really work well!

Subject: [Kenwood] Inexpensive (about $20 shipped) USB to Kenwood Computer
Interface

Hi Everyone,

I recently wanted to update my computer control cable on my TS-850SAT to
a USB one with RTS/CTS support. It took me a bit of work to get it all
sorted out, but the result was worth it, especially with IF-232C units
still going for more than $50 on ebay.

This interface should work with the following Kenwood radios: TS-50,
TS-60, TS-140, TS-440, TS-450, TS-680, TS-690, TS-711, TS-721, TS-790,
TS-811, TS-850, TS-950, R-5000.

I put up a short page on building it at:

http://people.
<http://people.wallawalla.edu/~Rob.Frohne/SDR/USB%20Interface/IF-232%20USB%2
0> wallawalla.edu/~Rob.Frohne/SDR/USB%20Interface/IF-232%20USB%20
Replacement.html

I hope this is of use to some of you, and that it will make doing it
much quicker and easier than it was for me.

73,

Rob, KL7NA

I believe this is what you're looking for.
Luckily I keep all these informative emails.
I had bought the chip that Rob talks about, but I wish I had waited and
bought the cable with the chip built into the usb connector.
Mouser has the cable, just search FTDI TTL232R on their site.

Hope this helps

I have been doing some thing very similar for the last couple of years. I
use the FTDI TTL232R cables. They have the chip built right in the USB
cable. All you have to do is make a 2mm header and away you. I have built
many of them for friends. I also use one on my FT1000. They really work
well!

Subject: [Kenwood] Inexpensive (about $20 shipped) USB to Kenwood Computer
Interface

Hi Everyone,

I recently wanted to update my computer control cable on my TS-850SAT to
a USB one with RTS/CTS support. It took me a bit of work to get it all
sorted out, but the result was worth it, especially with IF-232C units
still going for more than $50 on ebay.

This interface should work with the following Kenwood radios: TS-50,
TS-60, TS-140, TS-440, TS-450, TS-680, TS-690, TS-711, TS-721, TS-790,
TS-811, TS-850, TS-950, R-5000.

I put up a short page on building it at:

http://people.
<http://people. wallawalla. edu/~Rob. Frohne/SDR/ USB%20Interface/ IF-232%20USB% 2
0> wallawalla.edu/ ~Rob.Frohne/ SDR/USB%20Interf ace/IF-232% 20USB%20
Replacement. html

I hope this is of use to some of you, and that it will make doing it
much quicker and easier than it was for me.

73,

Rob, KL7NA

Hi...

Note that if you are looking for e-mails sent through the Yahoo Groups TS-850_450_690 group, the group archives exist on Yahoo and can be searched there. Just go to Yahoo, to Groups, then to the TS-850 group and search through them.

Date: 2009-12-02 02:22:08 UTC
From: Dave ve3wej
Topic: 8640 Message: 8640

anyone parting out a ts850 have a rf board x44-3120-00 in good working order

am even willing to exchange my old one, if it helps keep cost down

email @ ve3wej@... direct please

8641. Kenwood TS450S / TS690S - Need Digital Unit X-46-3120-00

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-12-03 02:29:53 UTC
From: Swen Röder
Topic: 8641 Message: 8641

Need: Digital Unit TS450 / TS690

I would like to ask for the Digital Unit for the Kenwood TS450 or TS690 ...
any version is ok if it's in working condition - HI!

These are the serial numbers... all serial numbers which are available.

1. Kenwood TS450S Digital Unit X46-3120-12

X46-3120-22
X46-3120-23
X46-3122-72
X46-3122-74

2. Kenwood TS690S Digital Unit X46-3120-11
X46-3120-21
X46-3122-71
X46-3122-73

Well this unit is not available from Kenwood dealer worldwide - I guess I
tried to contacted them all. I see only a chance too get one of this units
via 2nd handmarket ...

HS Situation:
You should know we are only allowed to use registered rig's ... my rig is
register but can not use it because of failure ... we also only allowed to
use registered rig's without 50MHz (6m) ... you know how difficult it is to
get a rig without 6m - almost impossible now... if they passed HS - NTC
approval!

Please offer Digital Unit's or Complete Rig's ....!

GD DX !

8642. Recieve Audio Level Adjustment with the ACC2 DIN?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-12-06 14:00:49 UTC
From: Jonathan
Topic: 8642 Message: 8642

I am using a Tigertronics SignaLink USB with the 13-pin ACC2 DIN on the rear for my receive audio. I have to crank the RX control fully clockwise to get just a modicum of audio to my PC for PSK31. Is there a control trimpot or other that allows me to raise this level to put the RX control in a useful middle range?
Those who use this configuration may be able to immediately understand what I mean.
Best regards and thx in advance.
Jonathan KC7FYS

Hi, kenwood makes two 500 hz cw filters for the ts-450. One of them can be placed in the 1st if stage (455 khz) and the other one made for the 2nd if stage (8830 khz).As I only want to buy one (they are a bit pricy)does anyone know what the different results would be? thanks ,cwcodebug,AA2XB.

You will get more side rejection in a crowded band with 2 filters - I have always run 2 Inrad 400Hz filters in mine - this will give you the best rejection of unwanted filters - I believe the 455khz is the tighter filter if you choose just one.

73 and have fun,

Bill N4ZI

The 455kHz one will always have the better shape factor.
The Kenwood filters are always turning up on ebay.com at reasonable prices.
Have you looked at the Inrad filters?

8646. PROBLEMS WITH MY TS 850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-12-06 15:09:34 UTC
From: eagle one
Topic: 8646 Message: 8646

Greetings everybody in this e-group.

I have ae Kenwood TS 850 with the following problems:-

1 - the dim button does not work.

2 - the fast tuning knob, to the bottom right of the main dial, works intermittently. When it does, it tunes in steps of 5MHz, and at times it does not work at all.

3 - I have to view the frequency display panel at eye level. Otherwise, if I view the panel slightly above or below, or to the right or to the left, I am not able to read the display.

I appreciate any suggestion to overcome these problems. Thank you and 73.

Hanafi - 9W2TZ - Malaysia.

adjust the trimpot IN the signal link, and then make sure your sound card is up fully, until overload level, then back off slightly

my 850 has more than enough for all modes. if yours is only a problem on psk, then check your software. it may be contolling volume on your soundcard separate from other apps

I concur. I have both of those filters in a TS-850 and when you look at how they perform using a PSK31 waterfall as a reference, it is clear that the 455 kHz filter has a narrower bandwidth and a steeper cutoff curve. YMMV.

Not sure if someone already mentioned, but there is a jumper (J2) inside the SignaLink (right behind the RX pot) that will boost the receive audio level.

That said, most people don't need it, so I would double-check all your levels before setting the jumper.

Josh (and to all),

Yes, It took me awhile to figure that out but through trial and error, it brought the audio level from the 30% range to the max (via DM780). If you had only sent this message out a couple weeks ago!!

I have been using the Signalink USB for over a year now on my 850 and I love it. I have won the Triple Play WAS award #197. I too had to adjust the RX audio in the Signlink but that was easy. It is a very good piece of equipment the only problem is I get RF feed back on 40 when I run the amp and when I TX in SSB (barefoot and with the amp). I have tried everything except working on the ACC2 Plug in the radio.
I use DM780 and I find it to be the best multimode digital soundcard program available and the price cant be beat it's FREE!!!!.
Have fun and Good Digital DX

I have a Signalink on my 450 SAT . I plugged it in and it worked great right out of the box on PSK-31. I have not tried any other modes. I like the idea of leaving the mike hooked up and not needing the sound card fir the radio, the settings for the computer sound card are independent of the Signalink.

I am thinking of buying a Signal Link to get away from the soundcard/speaker issue. I'm glad to hear someone out there is using one. Any other words of wisdom Dave???????

Jonathan, let us know how it turns out? Are you using an 850 or a 450?

adjust the trimpot IN the signal link, and then make sure your sound card is up fully, until overload level, then back off slightly

my 850 has more than enough for all modes. if yours is only a problem on psk, then check your software. it may be contolling volume on your soundcard separate from other apps

Subject: [TS-850_450_ 690] Recieve Audio Level Adjustment with the ACC2 DIN?

I am using a Tigertronics SignaLink USB with the 13-pin ACC2 DIN on the rear for my receive audio. I have to crank the RX control fully clockwise to get just a modicum of audio to my PC for PSK31. Is there a control trimpot or other that allows me to raise this level to put the RX control in a useful middle range?

Those who use this configuration may be able to immediately understand what I mean.
Best regards and thx in advance.

Topic: 8643 Message: 8655

Hi
As said, the 8.8mHz 1st IF (this is really the 2nd IF) filters will usualy have a poorer shape factor than their equivalent at 455kHz 2nd IF (wich is really the 3rd IF), and this is due to several reasons, such as higher q factor in the lower frequency filter (455kHz) and quality filters at higher frequencies are generaly much harder to construct with repeatable results. You seldom see amateurs constructing high quality 455kHz filters, let alone 8.8mHz filters. The reason why is because high quality crystal filter design and construction is still a black art to most amateurs.

Also, you want the selectivity to be just before the detector if you have a choice, but then again there's something to be said about selectivity as early in the IF chain as possible. When you have the 8.8mHz IF cw filter installed, but no 455kHz cw filter installed, the 455kHz filter that is employed will be passing around 2.4kHz or more of IF noise that it wouldn't if you had the cw filter installed in the 455kHz IF. Having the same selectivity in each IF is the best that you can get.

just some thoughts for you

Chris

TS-850S. I have the RX knob rotated fully clockwise. Hm.

That jumper JP2 did the trick. Thanks. Now it sits at 12:00 and I get a pretty good yellow/blue balance with lots of wiggle room on ccw and cw rotation.
Thanks!

Roland, thanks. Isn't RF feedback a typical problem with the TS-850S when using AFSK??????? I think it has been documented. There might even be a fix out there. I always ran RTTY in FSK on my 850 prior to PSK, etc. and it never was an issue. I run the AFSK stuff on my 870 which doesn't have this glitch.

I wonder if anyone else out there notices the feedback/distortion on SSB when the Signalink is connected to their 850/450?????

Thanks Darl.....interesting. Anything I connect to my 850s, 450s, two of each, to run AFSK, cause the RF feedback. That is with two different devices too.

Think power cord length and antenna proximity.

Clif

Hello everyone.
I do have a nice Kenwood TS-850s with the classic ALC problem. I've change the R2 and R3 on the DC-DC board to 18K as recommended, and the problem I thought to be solved but unfortunately it reappear after a few time.
What else could I do?

73, Dan YO3IBW

On the-same subject I would like to show you what I've find on the net. Another solution to supply the -6V output voltage for the ALC circuit.

http://homepage2.nifty.com/yamada_radio_clinic/archive/850_dc_dc
/850dcdc.htm

What do you think?

Thanks in advance.

8666. TS850S AGC Problem?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-12-09 12:01:52 UTC
From: davidjt01
Topic: 8666 Message: 8666

Gradually getting used to operating this rig - it seems less intuitive than most, but that could just be the operator....
I'm about to fit the Inrad roofing filter but before complicating things further, I need to explore a problem. I noticed yesterday on 80M that SSB signals appear strongest with the AGC off altogether, apparently diminishing as I switch through the positions FAST-MID-SLOW. This does not occur on 20M, for example - (and I do currently have a very poor antenna) but on all bands I get little or no 'S' meter reading without backing off the RF gain a long way, and what I do see then is static as opposed to varying with modulation. I'm guessing I have an AGC fault.
As a novice, I shall be learning as I go along, so any advice or suggestions would be very much appreciated.

I think replacing the active components on the alc board may help in this case.

This could be a solution Chris or maybe changing the whole DC-DC board with this, http://homepage2.nifty.com/yamada_radio_clinic/archive/850_dc_dc/850dcdc.htm

By the way, I notice that when the radio is just power on everything is working well, when I use it for few minutes the problem appear. I guess is related to the temperature inside. Any other suggestions?

As I was saying, it's a classic problem on the TS850s. My question is, what is the best solution on this? Should we change the active components (Transistors and Diodes) on the DC DC board and keep the 199x Kenwood solution to generate the -6V or replace the entire faulty board with a brand new circuit using the LTC1144, one resistor and probably one capacitor...?

8674. ts850 tf set button

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-12-11 17:42:47 UTC
From: shaun3416
Topic: 8674 Message: 8674

It was some time back when my ts850 stopped working,the dreaded dots and error message,i was led to beleive it was the dds chipps being the old ones.This was not the case, i had two boards and they were both repaired and new capps fitted by john mm3cbo they both are working with the old dds chips.Having got the radio to function the first thing ive found is a very faint crackling noise which will disappear after a few minutes,also if i press the tf set button the receiver sounds much better and like it should sound.Any thoughts on this id be gratefull

Regards Shaun

Hi Dave,
did as you suggested no rf feedback,turned carrier control,mic and power coontrols all the way back still the alc spikes all the way to the right no matter the mode on keying the mic.tried it also in a dummy load same result. AGAIN thanks for response.

Hi
I have suspected that a lot of the dds errors with the 450 and 850 were from bad solder joints and/or the vco tuning caps going bad. You might want to replace the vco caps with something of a better quality. Also, is the vco tuned to specs in the first place? The poor caps may be causing the crackling noise.

The tf set button moves the bfo all the way to the edge of the filter passband by design, and that is why you hear a difference when tf set is activated. Read up on its function in the manual and you will understand its function.

Chris

Subject: [TS-850_450_690] ts850 tf set button

It was some time back when my ts850 stopped working,the dreaded dots and error message,i was led to beleive it was the dds chipps being the old ones.This was not the case, i had two boards and they were both repaired and new capps fitted by john mm3cbo they both are working with the old dds chips.Having got the radio to function the first thing ive found is a very faint crackling noise which will disappear after a few minutes,also if i press the tf set button the receiver sounds much better and like it should sound.Any thoughts on this id be gratefull

Regards Shaun

Hi Chris,
Regarding the tf set button yes i understand now why the reception changes,so it seems its working as it should,another learning curve.The radio could do with a service and every thing checking over,il take it step by step.

Hi
I have suspected that a lot of the dds errors with the 450 and 850 were from bad solder joints and/or the vco tuning caps going bad. You might want to replace the vco caps with something of a better quality. Also, is the vco tuned to specs in the first place? The poor caps may be causing the crackling noise.

The tf set button moves the bfo all the way to the edge of the filter passband by design, and that is why you hear a difference when tf set is activated. Read up on its function in the manual and you will understand its function.

From: Dave ve3wej
Topic: 8686 Message: 8687

that is all I have, then I use the slope tune (on the 850) and also hamscope (and others) have a band pass for narrowing that works well, so I saw no reason to add more filters in my radio

remember psk @ 31hz, but you may want to see the 3k spectrum to view other ops..

Hi Kenny

I have 2 TS-450SAT'shere and have 2-500 cycle filters in the rig I use mostly for casual rtty and cw operation and 1-500 and 1-250 Inrad cycle filter in the one I use for contesting.

If possible, get the filters from Inrad. They are better than the Kenwood filters. 73

I was always under the impression that you do not want to run any filters with those digital modes. Doesn't the particular software and modem you use (HRD, FLDIGI et al) do enough filtering, or at least benefit more from unaltered receive audio, especially in weak signal reception?

If there is a strong signal within your filter passband, it will grab your receiver's AGC and knock the gain down, making copy more difficult on weak stations. Narrow filters make a big difference in RTTY contests when there are lots of strong signals on the band.

73,
Rich VE3KI

Start with C1 in the Car unit, nestled among those beautiful DDS IC's. It has probably leaked and shorted the TXB line which runs under it. When you get that mess cleaned up then go to the IF unit and locate the Tx/Rx module. The short in the Car board probably melted the solder on the Tx bias transistor. Look closely at the board and you will see it pulled away. You might get by with jusr resoldering it, worth a try anyway. I always just replace them to be safe.

Thanks Clif but the TXB line is OK. I will pull the TRX module and check it out kind of hard to see when it is on the main board even with a magnifier lamp. I did test the TXB and RXB and both were fine, Voltage on RXB in Receive and on TXB in transmit.

Ok, define "No Tx in Any Mode"? To me that means no tx. If the TXB and RXB are fine and switching is fine it's going into tx.

There is no power out, no bars on the display no current being drawn from the power supply over 3 1/2 amps, nothing in tx in any mode the TX indicator comes on. I was surprised when I saw that the TXB had voltage. I guess I will look at the Relay and final board next.

The S meter on my 850 does not function anymore,it receives ok ,attenuators are off and even with the rf gain turned all the back still no reading,the alc indicator has been going full scale for quite awhile now so i don't no if that has contributed to this problem.Any help appreciated.

with a receive signal, check for the input and output voltages mentioned in the service manual

I never had to get farthur than looking at the schematic, when my sound card device wa the cause...

you still did not answer the following

do the leds still work on transmit??? then check the sm amp board (x59-3830-00)

8711. Re: TS-850 No TX in Any Mode

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-12-23 20:05:12 UTC
From: ah6rr1
Topic: 8695 Message: 8711

I followed the TXB all the way to the Final board and had the correct voltage there. I then checked the voltages on the Final Board Transisitors and here is the voltages
Q1 RX Base 0 TX 1.58 Emitter RX 0 TX .84 Collector 13.8 RX & TX
Q2 Base RX 0 TX .67 Emitter 0 RX & TX Collector 13.8 RX & TX
Q3 Base RX 0 TX .67 Emitter 0 RX & TX collector 13.8 RX/TX
Q4 Base RX 0 TX .64 Emitter 0 RX/TX collector 13.8 RX/TX
Q5 same as Q4
Q6 & 7 Base RX 0 TX 1.3 Emitter o RX/tx Collector 13.8 RX/TX
I talked to the owner today and he told me the power supply blew a filter cap and the rectifer with the radio turned on. I did check the DRV Line and got the correct Frequency when in transmit and that was also the same out of the final board to. I did notice the RX is a little low I injected a 50uV signal and only got a S5 reading and it should be a S9. So my Question is where do I go from here I would really like to get this radio going for him as he is off the air until this is fixed.
Thanks
Roland AH6RR

That's not good. The finals don't like over about 16-17v.

You need to measure the drive level coming form the RF unit to the final. Terminate into a 50 ohm load and measure it with a scope. 4-5v min P-P. You can check the final by using the sig gen in place of the RF unit. Key the radio and input 0DBm into the final, you should see about 35-40w out on 20M.

The other problem is the RX. The s-meter should show S-9 at 20uV. 1uV is S-1.

+32dBu = 20uV according to the Japanese standard in which 0.5uV reference is used and not 1uV. This is clearly seen (thanks Cliff for once pointing this out to me)

Sorry to dispute your claim, but the manual clearly states that for S-9, the signal generator is to be set at a level of 32dBuV, and not 32dB over .5uV....
The "Preference" chart shows equivalent levels based on a Japanese standard of 0dB = .5uV....it does not say 0dBu = .5uV as that would not be true...

Read the chart on page 96 of the service manual. It shows the difference. 30Db = 15.8uV ergo 32 Db = 20uV and they clearly show 0dB as .5uV. Their reference is not the same as ours

On the newer radios they dropped the Japanese DbuV and went with dBm. And the S-9 setting is -81dBm which calculates (and is stated in the TS50 manual) to 20uV.

FWIW S-1 = -107 dBm = 1uV.

Clif

Subject: [TS-850_450_690] Re: TS-850 No TX in Any Mode

Read the chart on page 96 of the service manual. It shows the difference. 30Db = 15.8uV ergo 32 Db = 20uV and they clearly show 0dB as .5uV. Their reference is not the same as ours

On the newer radios they dropped the Japanese DbuV and went with dBm. And the S-9 setting is -81dBm which calculates (and is stated in the TS50 manual) to 20uV.

FWIW S-1 = -107 dBm = 1uV.

Clif

From: kc5cqw
Topic: 8686 Message: 8719

I usually leave the filters in the normal SSB settings and use the notch filter for stations that don't know how to adjust the mic gain. You know the ones that splatter all over the passband!

8724. Modulation Input Confirmation??????

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-12-25 16:20:35 UTC
From: Crownhaven
Topic: 8724 Message: 8724

When using the ACC input on the TS-450S/850S, the manual says the ALC can be controlled by the mic input level. I'm not finding this to be the case. What is your experience? I'm NOT using the mic connector on the radio.

Also, has anyone, running into the problem of data levels being too high on the ACC input, adjusted VR13 on the TS-450S or VR-18 on the TS-850S per the manual instructions when the ALC levels are too hot to be controlled with the mic input???????????

Steve, N4JQQ

PS, Merry Christmas or Happy Holidays, whatever your preference!

Remember, this Kenwood range has the "pre-amp" permanently engaged unless the "AIP" is on, thus the lower dBm for S9.

Regards and Christmas Greetings

you can also control your alc by reduced audio output of the sound card as well...

I use the 13 pin jack on the ts850 and yes the mike gain DOES control the audio in level......

Hi Dave.....not using the sound card. Running Pactor III with an SCS modem. I have the software in Air Mail cranked as low as it will go and the mic volume turned all the way down. I think I'm going to have to tinker with VR13.

Steve, N4JQQ

does the scs have internal controls, like tthe SC devices have. I dont know
the unit

8731. A Little Old

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2009-12-28 14:27:37 UTC
From: Richard Schmuke
Topic: 8731 Message: 8731

This is a little off topic but not quite. I have a TS-450 and use a signalink USB on PSK-31. A friend just emailed me with an offer of a TS-430 for favors done. It would be a good field day rig for PSK31.

I was wondering does anyone know if my computer interface cables/HRD control/ will work from my 450. I have not seen the 430 yet so I thought I would ask.

Rich ,KDØZZ

The likelyhood of damage to a component is inversely proportional to the number you have available, and directly proportional to its cost.

Richard

If I remember rightly the TS-430 does not have a CAT i/face, the only way of controlling basic frequency changes is via the up/down lines on the mic/accessory sockets. This rig was designed before the days of general use of computers for this application.

Nice rig though, had one in 1992, watch out for the relays, they tend to fail at this age..should just about be ok for psk31, if using for Amtor etc, you need to change various caps in the LT switching and AGC circuits, all of which are on the web.

Just wanted to say thanks to the group. I recently had a problem with my TS-850SAT and was able to search the post for the answer to the problem. It was the DC/DC board problem and I was able to buy a new one and have already replaced it. Turnaround time about 5 days. Not bad at all. Thanks to the group and all in it.

I checked the drive level and it is 4.5V P-P up into the drivers and I only get 1.5V P-P out of the drivers Q2&Q3 that is what I see at the Finals also. I am making a cable to try the Signal Gen but I do think its the drivers and maybe the finals also. Will update on the sig gen test when compleated.
Thanks Clif you advice is always the best.

Well the drivers aren't doing anything. You have the 1.5 at the base of the finals, what is on the collector. If not more then they are bad also.

Well Clif I made a mistake I only getting .150V on the Base and 1.5 on the collector of the finals so maybe the finals are still OK because thats a 10X gain, both the drivers are showing a short between the base an collectors I have ordered some drivers but the good thing is I have 4 finals that I removed from a chicken band amplifier that are good so that will save him some money. Thanks again for you knowledge and help your the best.
